17

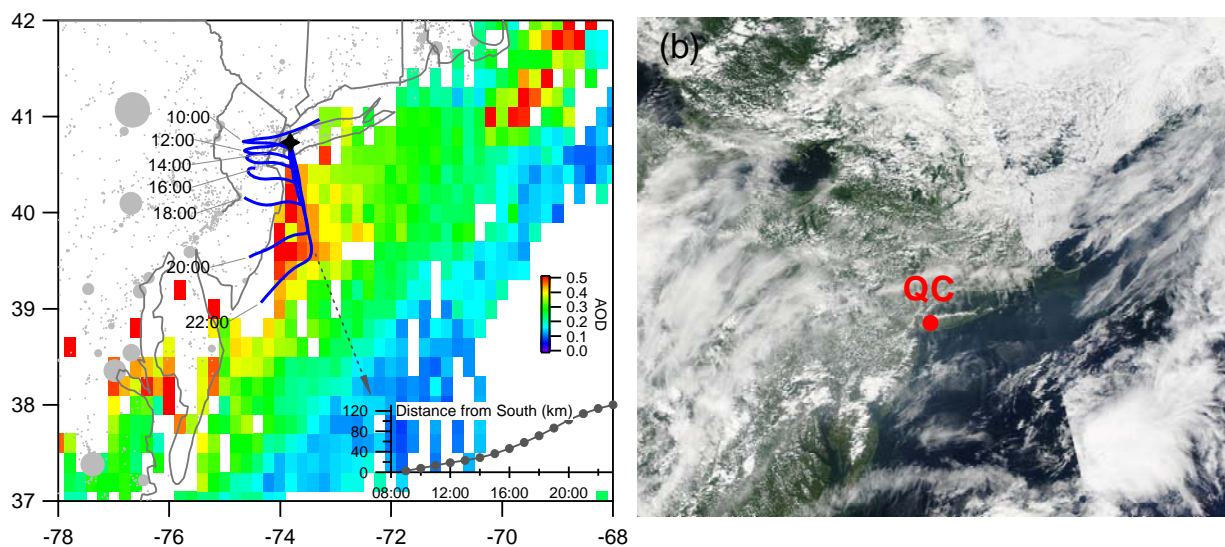

18
 19 Fig. S1. (a) Mass spectra of HOA and OOA for different size ranges, (b) and (c) show the mass
 20 spectral correlations between HOA / OOA and those identified from 2-component PMF analysis
 21 of bulk mass spectra of OA during this campaign (Ng et al., 2011) as a function of size.

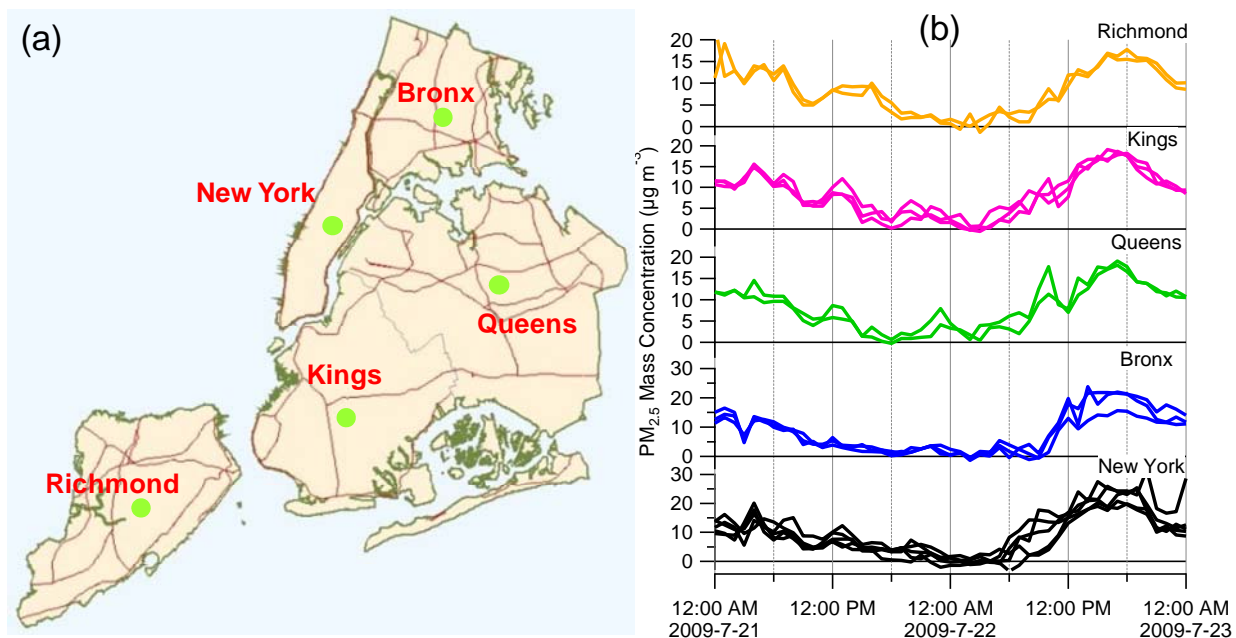

22

23 Fig. S2. Comparisons of HOA and OOA concentrations over different size ranges from CPCA
 24 with tracer-based method during (a) 14:00 – 18:00, 22 July (OOA: 85%; HOA: 15%), and (b)
 25 5:00 – 9:00, 22 July (OOA: 19%; HOA: 81%).

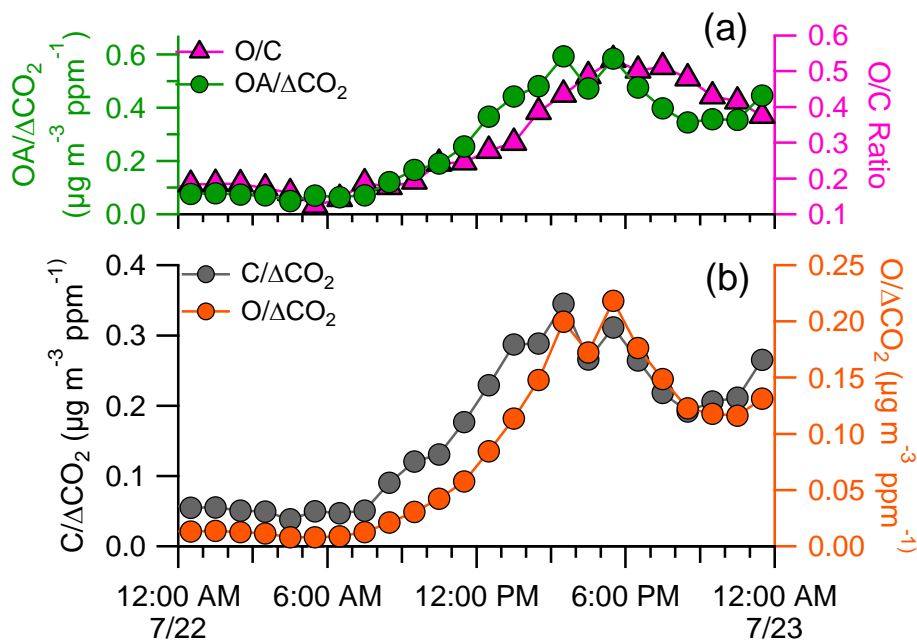

26

27 Fig. S3. 24-hour back trajectories arriving at QC on 22 July. The average aerosol optical depth
 28 (AOD) on 22 July is shown for a reference. The gray solid circles indicate the intensity of SO₂
 29 emissions in U.S. The inset plot presents the straight distance of trajectories from the south. (b)
 30 shows the MODIS image from Aqua satellite (afternoon) on 22 July
 31 (<http://rapidfire.sci.gsfc.nasa.gov/subsets/?subset=USA4>).

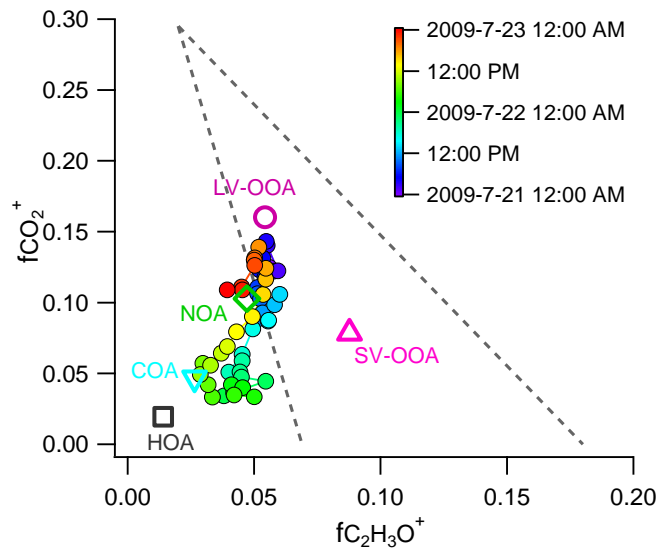

33

34 Fig. S4. Variations of $PM_{2.5}$ from TEOM measurements in different regions in New York City
 35 from 21-22 July, 2009. The multiple lines in (b) represent the data from various air monitoring
 36 stations in each region. The map and the data are obtained from <http://www.dec.ny.gov>.

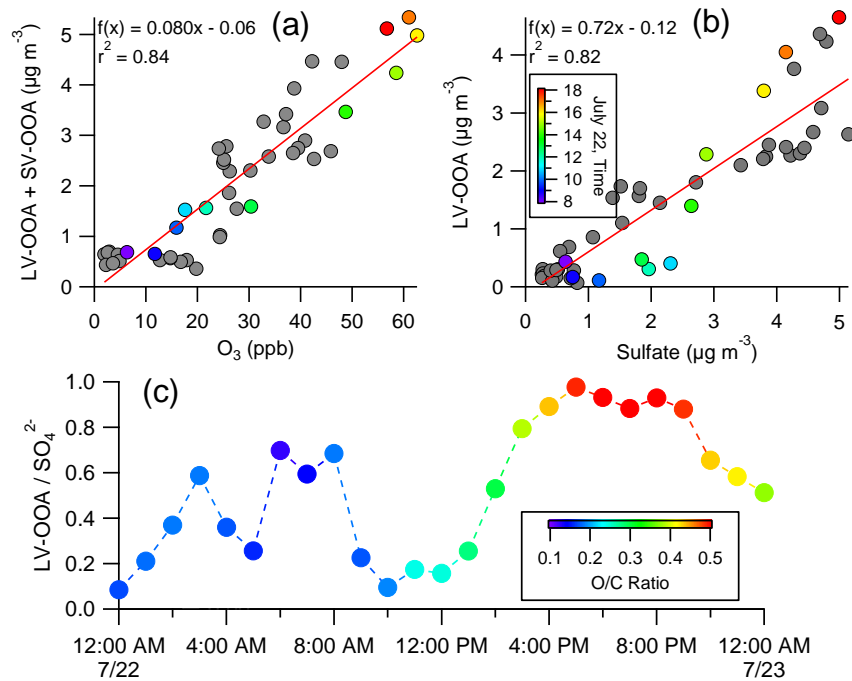

37

38 Fig. S5. Variations of (a) $OA/\Delta CO_2$ and O/C ratio, and (b) $C/\Delta CO_2$ and $O/\Delta CO_2$ on 22 July.

39

40 Fig. S6. (a) Relationship between $f\text{CO}_2^+$ (fraction of CO_2^+ to total organic signal) and $f\text{C}_2\text{H}_3\text{O}^+$
 41 (fraction of $\text{C}_2\text{H}_3\text{O}^+$ to total organic signal) from 21 – 22 July. The $f\text{CO}_2^+$ vs $f\text{C}_2\text{H}_3\text{O}^+$ for five OA
 42 components are also shown. The dash lines represent the triangle region from Ng et al., (2010).

43

44

45 Fig. S7. Correlation plots of (a) LV-OOA+SV-OOA vs. O_3 and (b) LV-OOA vs. SO_4^{2-} . (c)
 46 shows the variation of LV-OOA/ SO_4^{2-} ratio on 22 July. The correlations between 8:00 – 18:00
 47 on 22 July are colored by the time.
