21 **Table SI-1.** The VOC parameters used to model the formation of SOA (Atkinson and Arey, 2003; Carter, 2010; Tsimpidi et al., 2010).
 22 All aging of VOCs after the initial oxidation reaction occurs with a gas-phase rate constant of $k_{OH} = 1 \times 10^{-11} \text{ cm}^3 \text{ molec}^{-1} \text{ s}^{-1}$. Note
 23 that the aging rate constant was erroneously reported as $4 \times 10^{-11} \text{ cm}^3 \text{ molec}^{-1} \text{ s}^{-1}$ in Tsimpidi et al. All SOA from VOCs has a ΔH_{vap} of
 24 36 kJ mol^{-1} (Volkamer et al., 2006).

Precursor Family Name	Compounds	k_{OH} ($\text{cm}^3 \text{ molec}^{-1} \text{ s}^{-1}$)	$\Delta\text{VOC}/\Delta\text{CO}$ (ppt ppb $^{-1}$)	Stoichiometric SOA yield High- NO_x , 298 K, ($\mu\text{g m}^{-3}$)				M.W. (g mol $^{-1}$)
				1	10	100	1000	
ALK5	Methylcyclopentane	5.68×10^{-12}	0.566	0.000	0.015	0.000	0.000	150
	Cyclohexane	6.97×10^{-12}	0.285					
	Methylcyclohexane	9.64×10^{-12}	0.202					
	n-Heptane	6.76×10^{-12}	0.398					
	2-Methyl Hexane	6.89×10^{-12}	0.385					
	3-Methyl Hexane	7.17×10^{-12}	0.460					
	2,3-Dimethyl Pentane	7.15×10^{-12}	0.252					
	2,4-Dimethyl Pentane	4.77×10^{-12}	0.171					
	2,2,3-Trimethyl Butane	3.81×10^{-12}	0.031

TERP	α -Pinene + β -Pinene + Limonene	98.2×10^{-12}	N/A (see text)	0.012	0.122	0.201	0.5	180

27

28 **Table SI-2.** Summary of the Robinson et al. (2007) and the Grieshop et al. (2009) parameterizations for P-S/IVOCs.
 29

$c^* @ 300 \text{ K}$ ($\mu\text{g m}^{-3}$)	ΔH_{vap} (kJ mol^{-1})		Molecular Weight (g mol^{-1})		Fraction of total P-S/IVOC (%)
ROB & GRI	ROB	GRI	ROB	GRI	ROB & GRI
0.01	112	77	250	524	1.2
0.1	106	73	250	479	2.4
1	100	69	250	434	3.6
10	94	65	250	389	5.6
100	88	61	250	344	7.2
1,000	82	57	250	299	12
10,000	76	54	250	254	16
100,000	70	50	250	208	20
1,000,000	64	46	250	163	32

30

	ROB	GRI
k_{OH} at 300 K ($\text{cm}^3 \text{ molec}^{-1} \text{ s}^{-1}$)	4×10^{-11}	2×10^{-11}
Oxygen gain per oxidation generation (%)	7.5	40
Volatility bin decrease per oxidation generation	1 order of magnitude	2 orders of magnitude

31

32 **Table SI-3.** Initial concentrations of primary IVOCs predicted by the box model (ROB parameterization) in comparison with data
33 from Zhao et al. (2014) as a function of the saturation concentration (C^*) at 298 K. Note that the corresponding results for the GRI
34 parameterization are very similar with the concentration being 8% higher due to differences in the ΔH_{vap} .

35

C^* ($\mu\text{g m}^{-3}$)	Estimated Primary IVOCs ($\mu\text{g m}^{-3}$)	Estimated Primary IVOCs without cooking emissions ($\mu\text{g m}^{-3}$)	Measured Primary IVOCs ($\mu\text{g m}^{-3}$)
10^3	2.47	1.70	0.21 (± 0.07)
10^4	3.30	2.27	1.39 (± 0.29)
10^5	4.12	2.84	2.64 (± 0.64)
10^6	6.59	4.54	3.82 (± 0.99)

36

37 **Table SI-4.** Summary of tracers used by the EPA group to determine the concentration of SOA from a certain precursor.

38

Tracer Molecule	Precursors	Reference
2-Methylglyceric acid	Isoprene	Edney et al. <i>Atmos. Environ.</i> 2005 , 5281-5289.
2-Methylthreitol	Isoprene	Edney et al. <i>Atmos. Environ.</i> 2005 , 5281-5289.
2-Methylerythritol	Isoprene	Edney et al. <i>Atmos. Environ.</i> 2005 , 5281-5289.
3-Acetyl pentanedioic acid	Monoterpenes	Jaoui et al. <i>Environ. Sci. Technol.</i> 2005 , 5661-5673.
3-Acetyl hexanedioic acid	Monoterpenes	Jaoui et al. <i>Environ. Sci. Technol.</i> 2005 , 5661-5673.
3-Methyl-1,2,3-butanetricarboxylic acid	Monoterpenes	Szmigielski et al. <i>J. Geophys. Res.-Atmos.</i> 2007 , L24811.
3-Hydroxyglutaric acid	Monoterpenes	Claeys et al. <i>Environ. Sci. Technol.</i> 2005 , 1628-1634.
3-Hydroxy-4,4-dimethylglutaric acid	Monoterpenes	Claeys et al. <i>Environ. Sci. Technol.</i> 2005 , 1628-1634.
Pinic acid	Monoterpenes	Claeys et al. <i>Environ. Sci. Technol.</i> 2005 , 1628-1634.

39

40 **Figure Captions**

41

42 **Figure SI-1.** The evolution of OA/ Δ CO versus photochemical age for CalNex separated by cloudy days and mostly clear days. Δ CO is
43 calculated as the difference of the ambient CO and the background CO (105 ppb) (Hayes et al., 2013). The cloudy days are 17 and 27
44 May 2010, as well as 11 June 2010.

45

46 **Figure SI-2.** Model/measurement comparisons of the diurnal cycles for selected VOC mixing ratios as well as for POA mass
47 concentrations. Note that for the VOCs the GRI+TSI, ROB+TSI, PYE+TSI, ROB+4xV model variations give the same results.

48

49 **Figure SI-3. (Top)** Scatter plots for naphthalene, 1-methylnaphthalene, and 2-methylnaphthalene versus CO mixing ratios. Data
50 includes only measurements from 00:00 – 06:00 (local time) to minimize the impact of photochemical oxidation on the PAH
51 concentrations. Also shown in the top panels are the linear ODR analyses of the data with the y-intercept fixed at 105 ppb CO, which
52 is the background CO concentration (Hayes et al., 2013). For more information on the methodology used to measure naphthalene and
53 the methylnaphthalenes see Presto et al. (2011; 2012). **(Bottom)** Model and measurement diurnal cycles for naphthalene, 1-
54 methylnaphthalene, and 2-methylnaphthalene.

55

56 **Figure SI-4.** Anthropogenic CO fluxes on a 12 km grid in Southern California that are used in the WRF-Chem simulation. The box
57 indicates the region around and inside LA where the emissions of atmospheric species are set to zero in order to determine the
58 concentration of background SOA.

59

60 **Figure SI-5.** Model/measurement comparison of SOA mass concentrations after excluding from the model P-S/IVOC emissions, or in
61 the case of the PYE+TSI variation, SVOC emissions from cooking-related activities. Otherwise the figure is identical to Figure 4 in
62 the main text.

63

64 **Figure SI-6:** The estimated relative concentration of SOA from gasoline vehicles, diesel vehicles, cooking emissions, in-basin
65 biogenic emissions, and the regional background.

66

67 **Figure SI-7:** Model/measurement comparison of SOA mass concentration after reducing the emission of IVOCs in the model by one-
68 half. Otherwise the figure is identical to Figure 4 in the main text.

69

70 **Figure SI-8:** Scatter plots of **(A)** benzene, **(B)** low-yield aromatic VOCs, and **(C)** high-yield aromatic VOCs measured by GC-MS
71 against the concentration predicted by WRF-CMAQ. The low-yield aromatics correspond to the family ARO1 and the high-yield
72 aromatics to the family ARO2 in Table SI-1. Also shown for reference are the 5:1, 1:1, and 1:5 lines. **(D)** SOA/ Δ CO as a function of
73 photochemical age as determined by measurements (black circles) and predicted by WRF-CMAQ (red squares). The left and right
74 axes are plotted on different scales for clarity. Photochemical age is determined from the ratio of NO_Y to NO_X (Hayes et al., 2013).

75

76 **Figure SI-9:** Time series of inorganic and organic aerosols at the Pasadena ground site during CalNex measured by an AMS or
77 modeled by WRF-CMAQ. For SOA, the concentration was determined using positive matrix factorization analysis of the AMS
78 measurements. The AMS measurements have a PM₁ size cut, and the WRF-CMAQ model results are the sum of the Aiken and
79 accumulation modes, which corresponds to PM_{2.5}. (Note: In WRF-CMAQ all SOA species are assigned to the accumulation mode.)

80

81 **Figure SI-10:** Scatter plots of the inorganic aerosol measurements from an AMS against the modeled concentrations from WRF-
82 CMAQ. The data shown are the same as in Figure SI-9. Also shown are the corresponding linear ODR analyses and corresponding fit
83 parameters.
