Supplement of

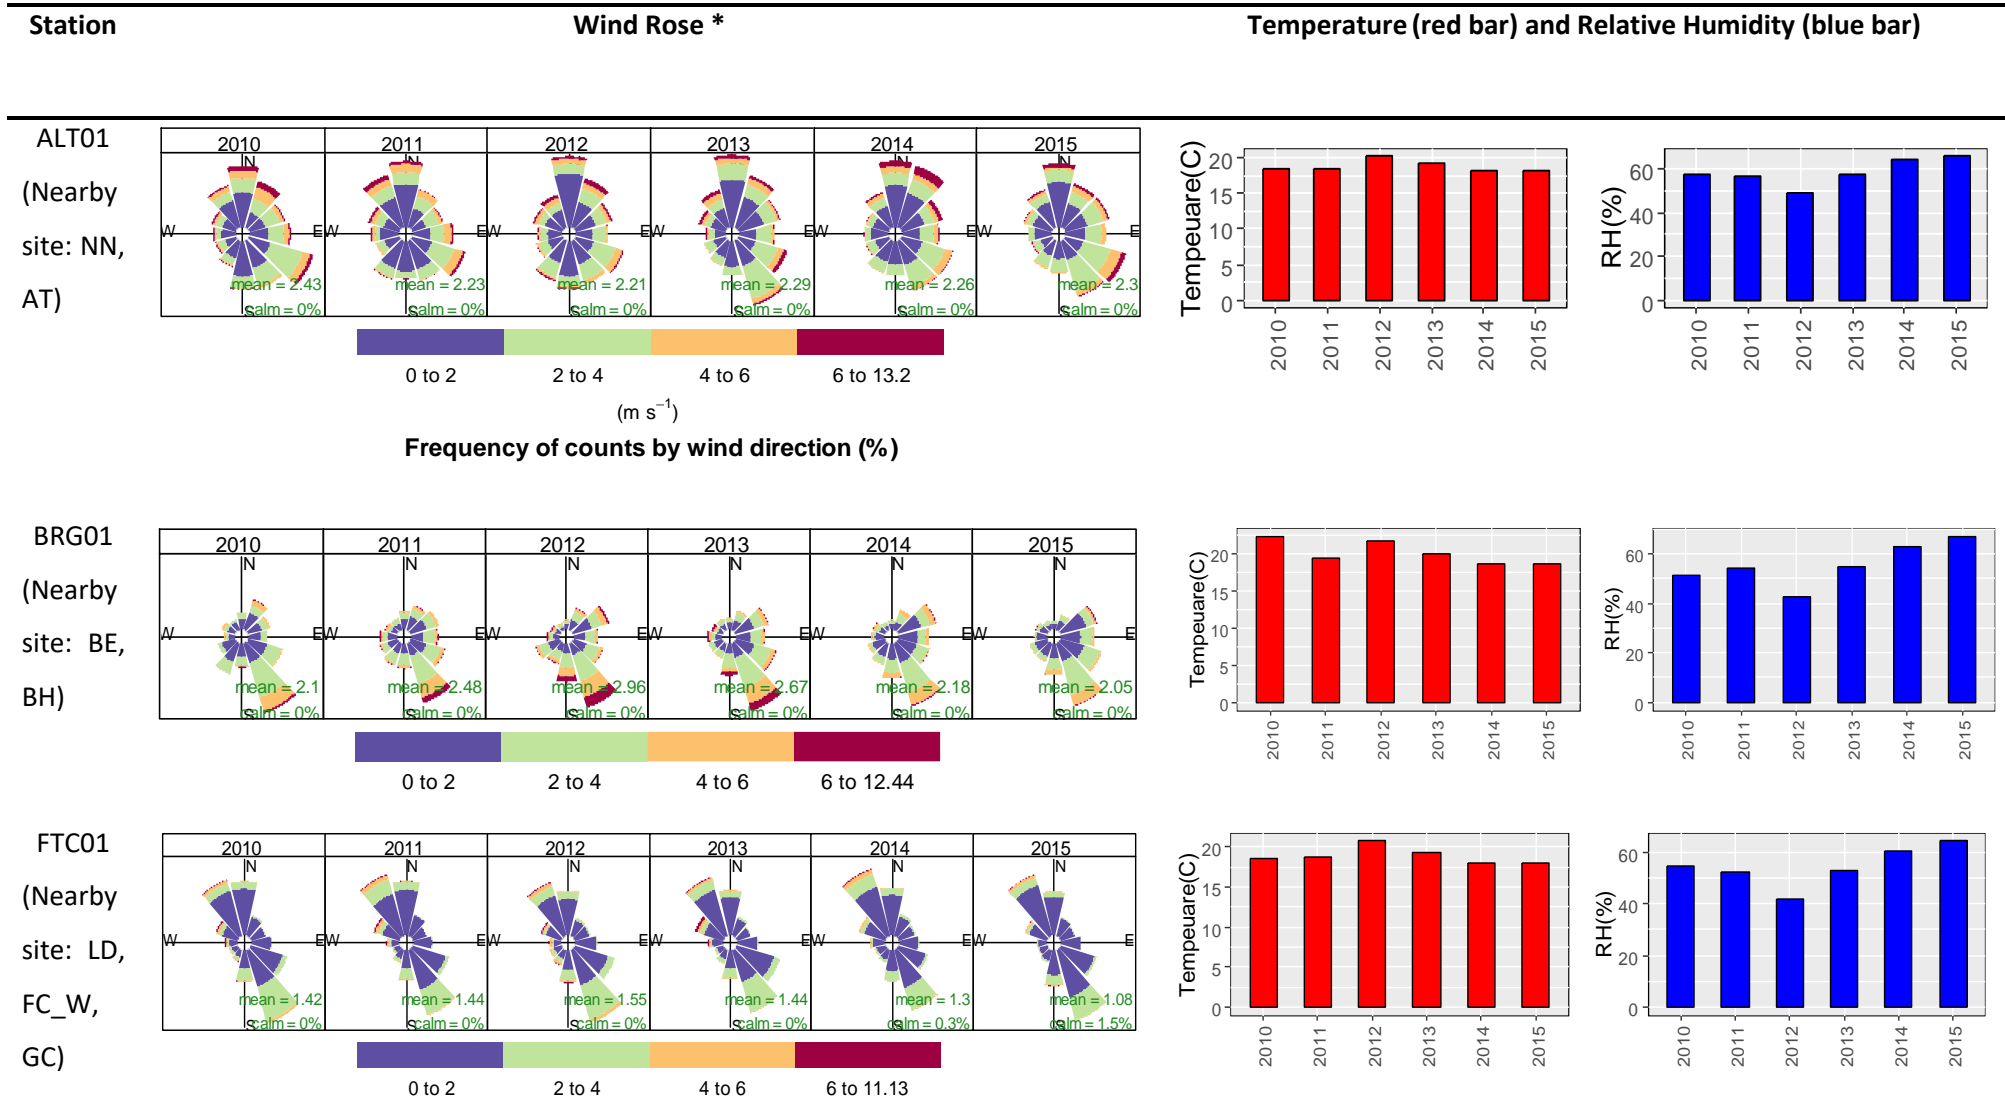

Temporal and spatial variability of ammonia in urban and agricultural regions of northern Colorado, United States

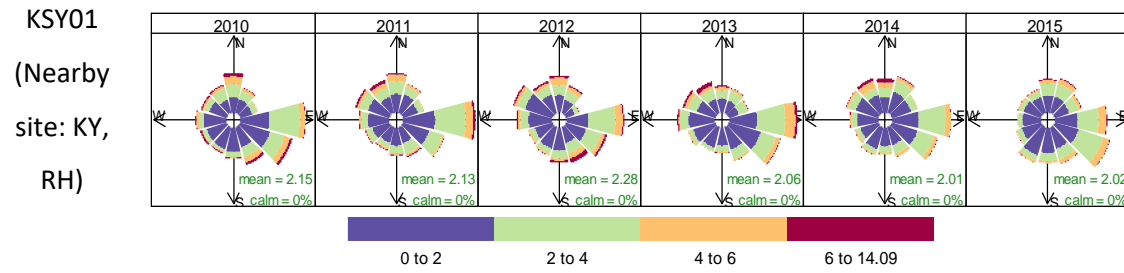

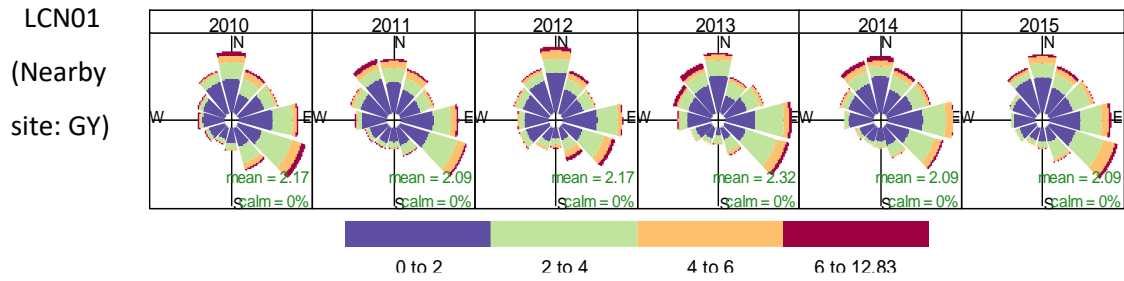

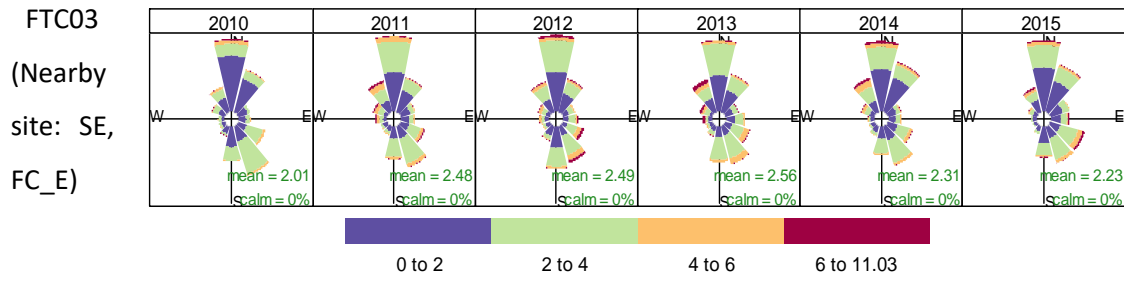

Yi Li et al.

Table S1. Meteorological information near the sites from May to August in each year

* Wind speeds (unit: m/s) were indicated by color bars

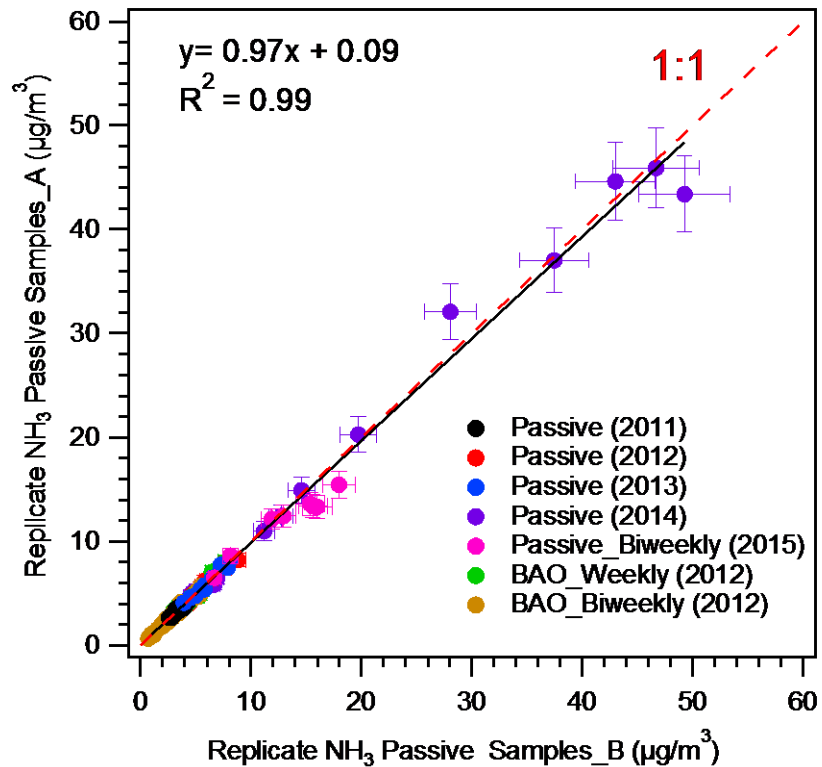

Fig.S1. Comparison of ammonia concentrations measured by replicate passive samples. The error bars represent the relative standard deviation of 8.9 % calculated from all 288 pooled replicate samples.

Fig.S2. Comparison of NH₃ concentrations from the Radiello passive samplers and URG samplers.

Fig.S3. (a) NH₃ concentration versus temperature at 10 m and 300 m and (b) correlation coefficients between NH₃ concentration and temperatures at different heights of the BAO tower.

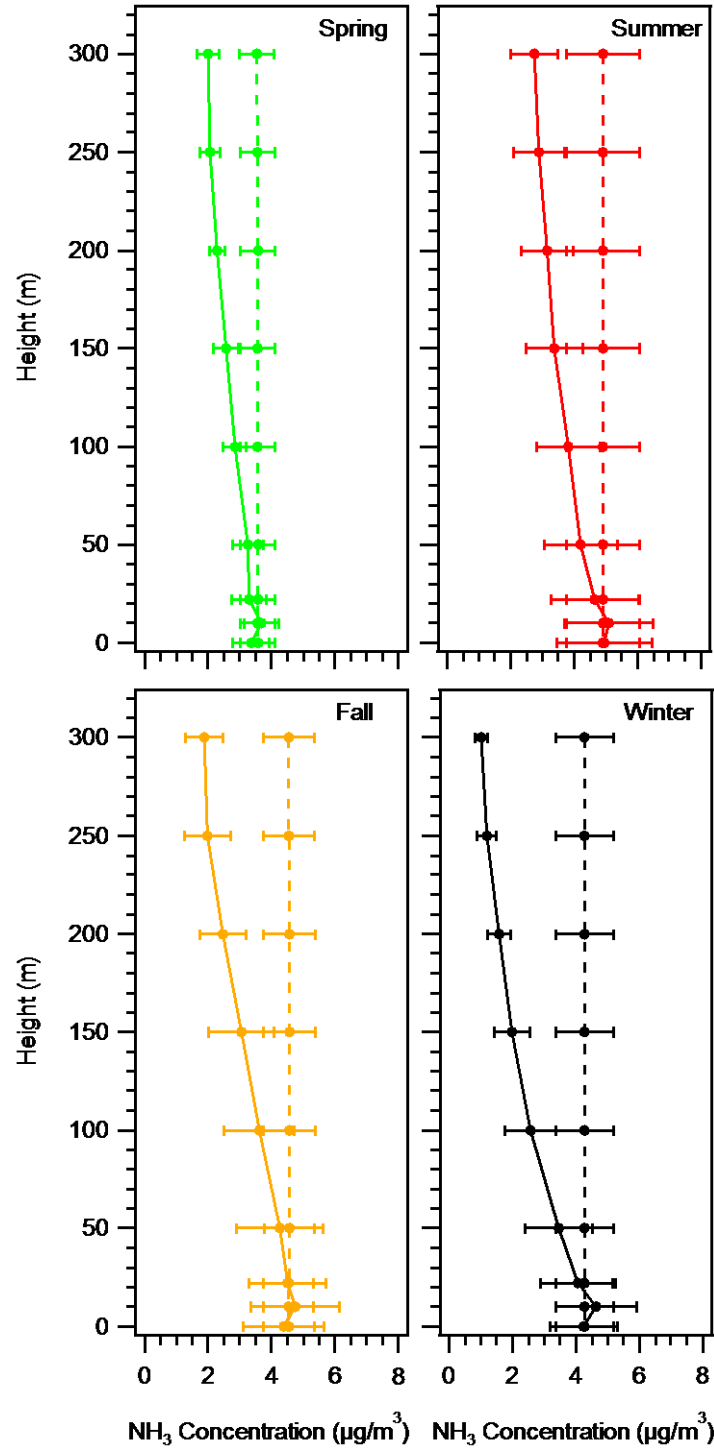

Fig.S4. Seasonal average vertical profiles of NH₃ measured at the BAO tower (solid line) and ISORROPIA II model results (dashed line) in 2012. The x-error bars represent the relative standard deviation of NH₃ concentrations.

Fig.S5. Satellite image of the wildfire plume over northeastern Colorado caught by the Moderate Resolution Imaging Spectroradiometer (MODIS) (Image downloaded at <http://loatec.univ-lille1.fr/TerreEtCiel/module.php?lang=us>). The FC_W site is indicated by a yellow star.

Fig.S6. The 36-km horizontal grid resolution outer domain, represented by the extent of the larger box, covers the contiguous United States, northern Mexico, and southern Canada. The 12-km domain includes states surrounding Colorado. The inner 4-km domain extends over Colorado, Utah, Wyoming and portions of surrounding states.
