Supplement of

Primary and secondary organic aerosol from heated cooking oil emissions

Tengyu Liu et al.

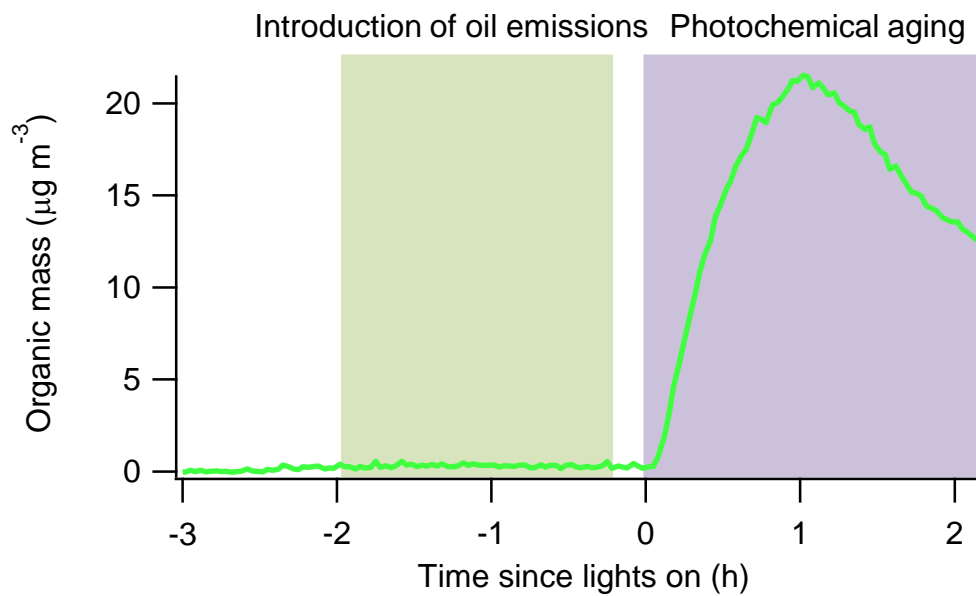

Fig. S1. Time series of organic mass concentration in a pure SOA experiment (sunflower oil). The emissions from heated sunflower oil were introduced from $t = -1.95$ h to $t = 0.38$ h. The POA concentration was lower than $0.5 \mu\text{g m}^{-3}$ and thus was considered as negligible.

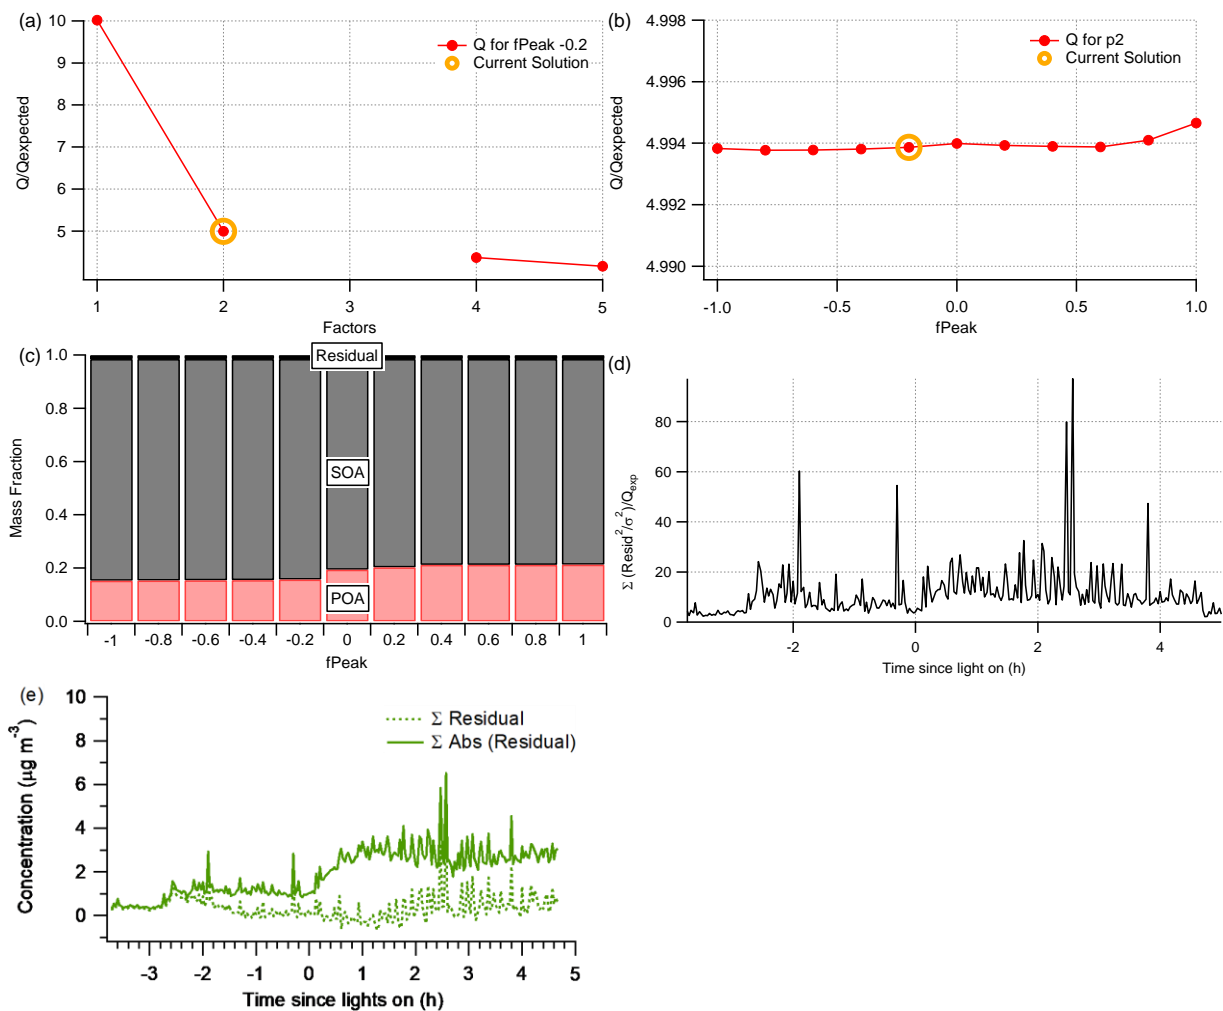

Fig. S2. Diagnostic plots of the PMF analysis for the palm oil experiment. The following plots are shown (a) Q/Q_{exp} vs number of factors; (b) Q/Q_{exp} vs. f_{Peak} for the solution with optimal number of factors; (c) mass fraction of PMF factors vs. f_{Peak} ; (d) the time series of Q/Q_{exp} ; (e) the residual of PMF solutions.

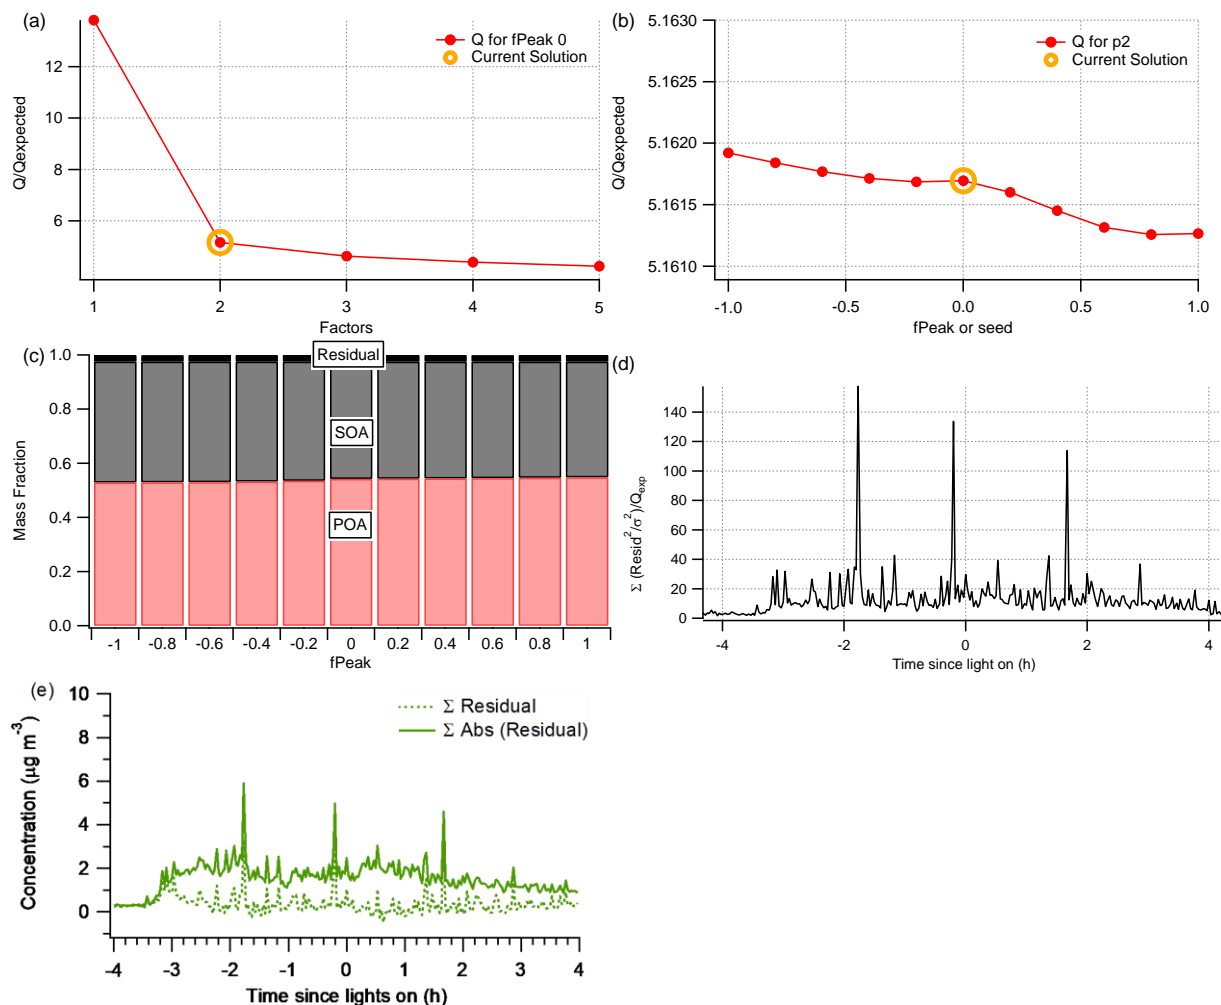

Fig. S3. Diagnostic plots of the PMF analysis for the olive oil experiment. The following plots are shown (a) Q/Q_{exp} vs number of factors; (b) Q/Q_{exp} vs. fPeak for the solution with optimal number of factors; (c) mass fraction of PMF factors vs. fPeak; (d) the time series of Q/Q_{exp} ; (e) the residual of PMF solutions.

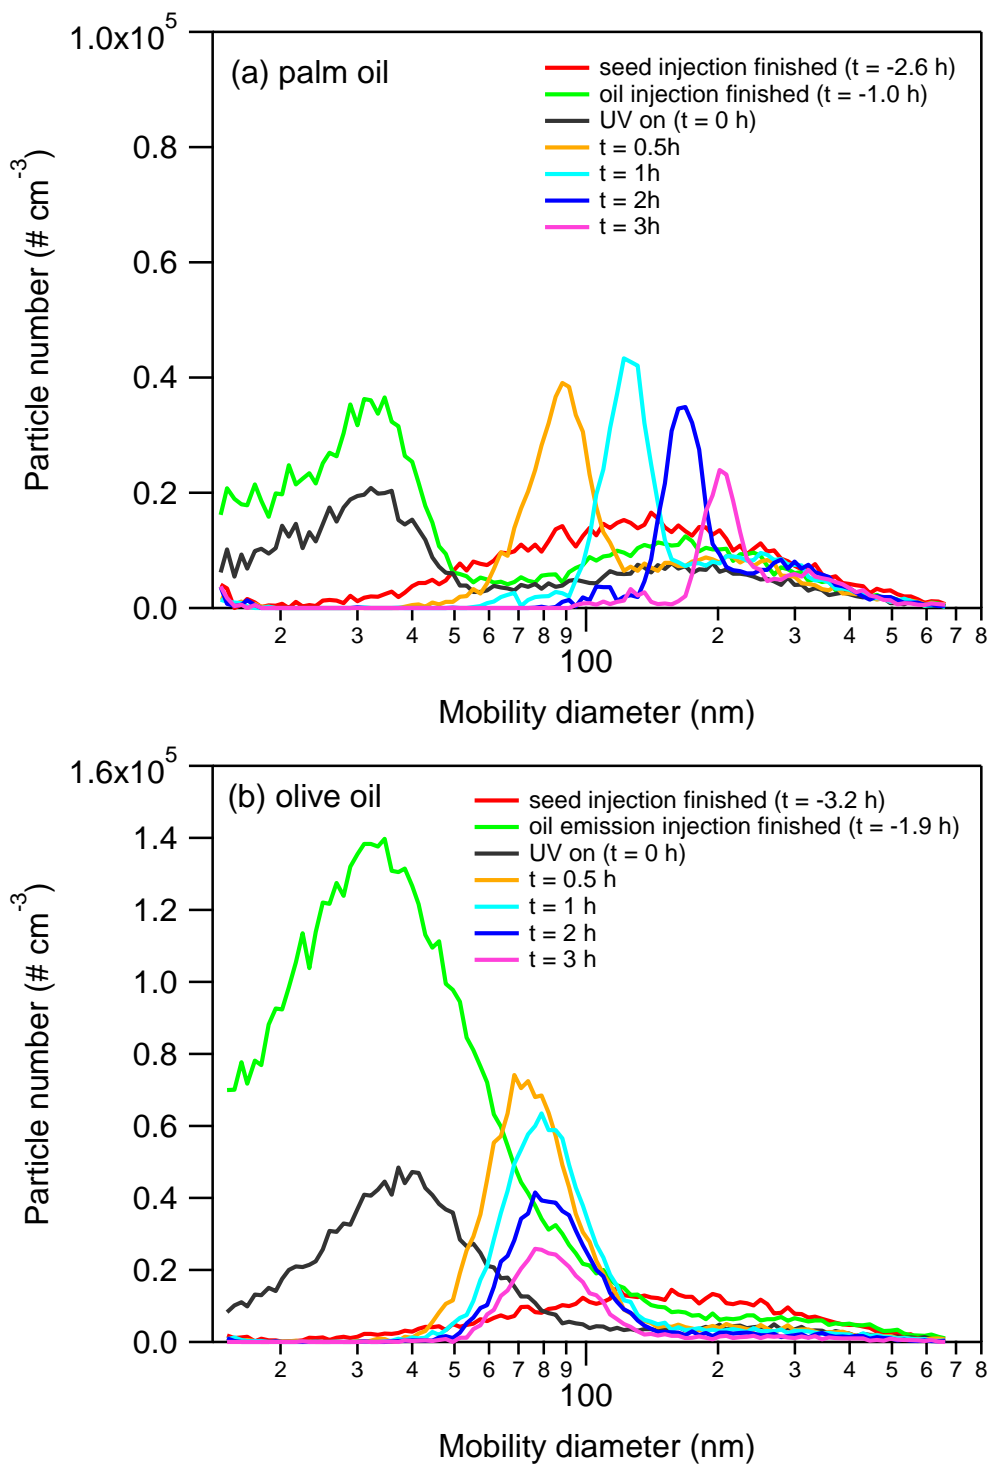

Fig. S4. Evolution of particle number size distribution for (a) palm and (b) olive oil experiments.

Fig. S5. Time series of the three factor solutions of PMF analysis with $f_{\text{Peak}} = 0$ for the olive oil experiment.

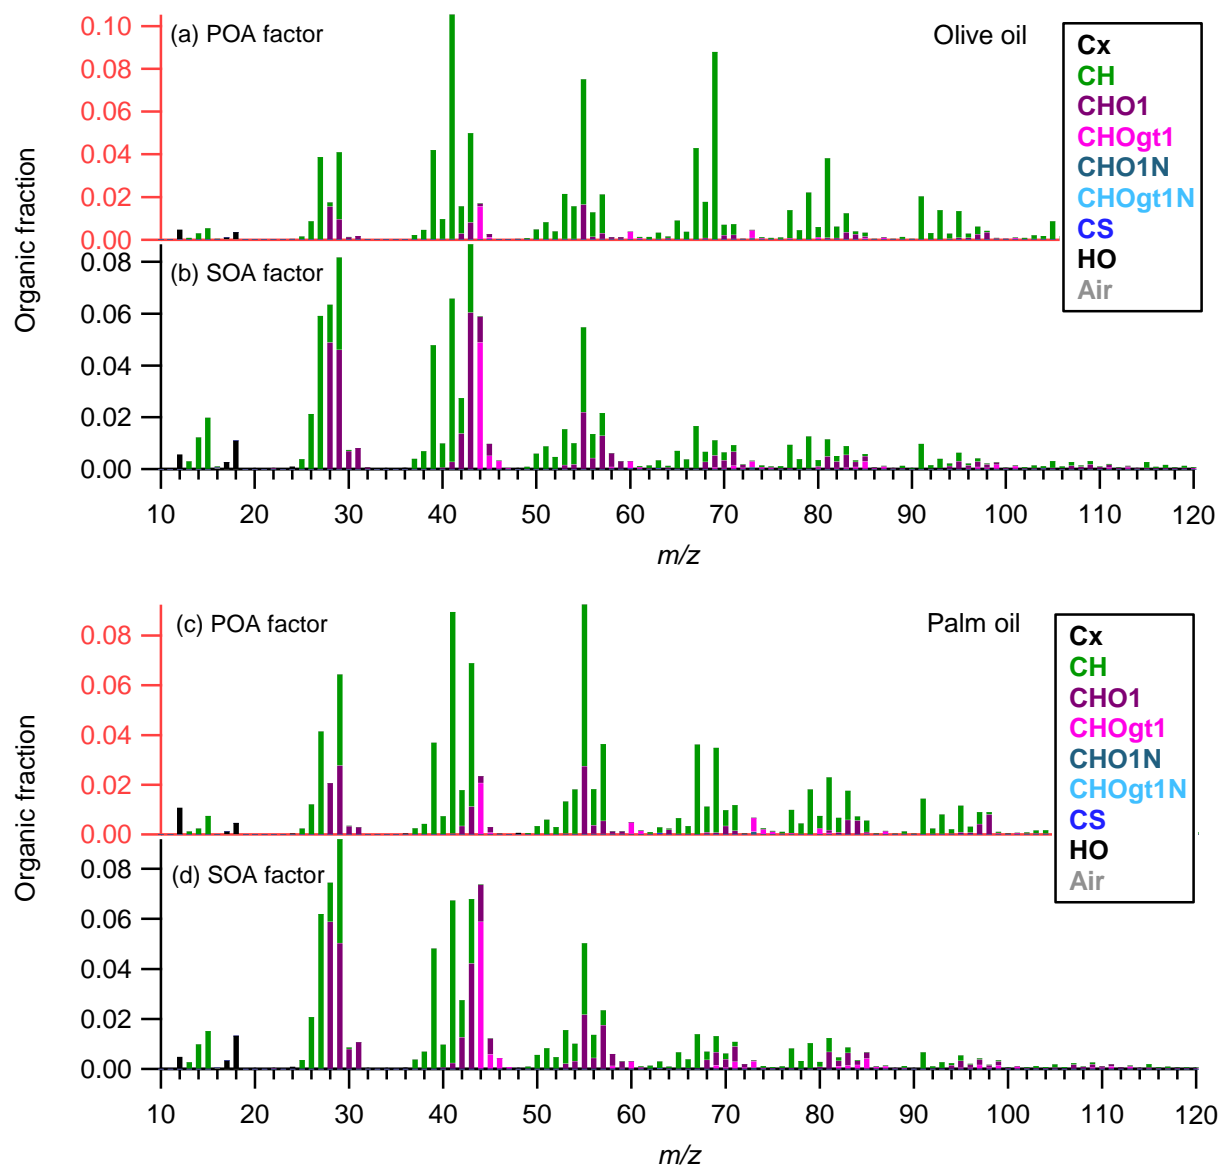

Fig. S6. High-resolution mass spectra of PMF-derived POA and SOA factors for the olive and palm oil.

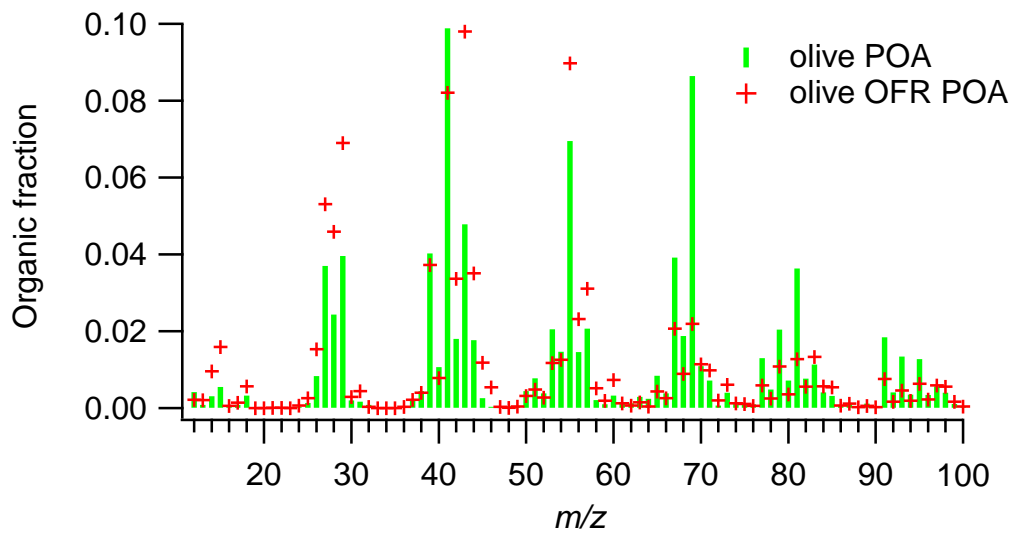

Fig. S7. Mass spectra of POA emissions in this study and POA measured in an oxidation flow reactor (Liu et al., 2017) for olive oil.
