ANN type	ANN architecture	Advantages	Disadvantages
JE1	6 hidden layers Momentum learning rule Processing elements 50 for the first four layers 45 for the fifth layer 37 for the sixth layer Tanh axons Trained for at least five cycles of 1000 epochs	Good percentage of training per aerosol class. Stable performances and approximatively constant for all aerosols classes.	Slow training/time consuming. Reach the training limit rapidly.
JE2	8 hidden layers Conjugate gradient learning rule Processing elements 50 for the first four layers 45 for the fifth layer 37 for the sixth layer 32 for the seventh layer 28 for the eight layer Tanh axons Trained for at least five cycles of 1000 epochs	Good percentage of training per aerosol class. Rapid training.	Only few training cycles can be done. Limited performance improvement after training.
GFF	10 hidden layers Momentum learning rule Processing elements 50 for the first four layers 45 for the fifth layer 37 for the sixth layer Tanh axons Trained for at least five cycles of 1000 epochs	Low error of training after two training cycles. Rapid training.	It trains efficiently only several cycles a further improvement of weights cannot be considered. Stable active performances per aerosol type overall but lower values for several classes.
