Equation (5) of the paper relates the filling level \( D_p \) of a conical pore to the radius of the meniscus for a set contact angle \( \theta_{ws} \). This equation lacks the dependence on the pore opening angle \( \delta \), which becomes important for larger opening angles. Including the opening angle, this equation reads as

\[
D_p = -2r_m(T)\cos(\theta_{ws} + \delta). \tag{5}
\]

Also in Sect. 5.1, the equations for capillary condensation in conical and wedge-shaped pores do not include the opening angle. These equations including the opening angle read as

\[
D_p(T) = \frac{-4\gamma_v(T) v_i(T, P_0) \cos(\theta_v(T) + \delta)}{kT \ln \frac{p}{p_i(T, P_0)}} \tag{27}
\]
and

\[
D_1(T) = \frac{-2\gamma_v(T) v_i(T, P_0) \cos(\theta_v(T) + \delta)}{kT \ln \frac{p}{p_i(T, P_0)}} \tag{28}
\]

See the updated Fig. 2 for the definition of \( \delta \).

Moreover, there is an error in Eq. (A4). In its corrected form, it reads as

\[
\kappa \frac{\partial T}{\partial P} = -0.0003805 + 6.639 \times 10^{-6} \cdot (T - 273.15) - 9.688 \times 10^{-8} \cdot (T - 273.15)^2. \tag{A4}
\]
