27 Table S1. Range of model hyperparameters tested during training/validation of the GBRT

28 models through a combination of grid and random searches. Final model values are also

- 29 listed in the last column.
- 30

Model parameter	Range of values tested	Final model values (DJF/JJA)	
Learning rate	0.001-0.1	0.05/0.05	
Number of estimators	100-5000	400/400	
Maximum depth of a tree	2-35	9/11	
Minimum number of samples to split an internal node	20-100	66/45	
Minimum number of samples at a leaf node	20-60	31/66	

33 Table S2: Mean seasonal values of speciated AOD and surface mass concentration for black

34 carbon, dust, organic carbon, sulfate, and sea-salt for the six sub-domains in Figure S1.

Speciated AOD/Surface mass concentration	ion (µg 1	<u>n</u>)

- 47
- 48 Figure S2: Seasonal maps of the coefficient of determination (R²) and number of points for
- 49 the analysis of the aerosol-cloud interaction (ACI) parameters over the WNAO using daily
- 50 N_d and four different aerosol proxy parameter values (AI, AOD, Sulfate_{AOD}, Sulfate_{sf-mass})
- 51 from CERES-MODIS and MERRA-2, respectively. ACI statistics associated with the six
- 52 sub-domains shown are summarized in Table 4.
- 53

- 55 Figure S3: Seasonal climatology of N_d (middle column) and anomalies from seasonal averages for low-N_d days (left column) and high-N_d days (right column). The red box 56
- 57 represents sub-domain C-N for which the analysis was conducted, as explained in Section
- 58 4.1.

- 61 seasonal averages for low-N_d days (left column) and high-N_d days (right column). The
- 62 reference wind vector is shown on the top left panel. The red box represents sub-domain C-
- 63 N for which the analysis was conducted.

Figure S5: Seasonal averages of low-level liquid cloud-top effective height (middle column)

- and associated anomalies on low-N_d days (left column) and high-N_d days (right column). The
- 67 red box represents sub-domain C-N for which the analysis was conducted.

Figure S6: Seasonal averages of PERSIANN-CDR precipitation rate (middle column) and associated anomalies on low-N_d days (left column) and high-N_d days (right column). The

- $\begin{array}{l} 70 \\ 70 \end{array} \text{ associated anomalies on low-N_d days (left column) and high-N_d days (right red box represents sub-domain C-N for which the analysis was conducted.} \end{array}$
- 72

74

Figure S7: Seasonal averages of planetary boundary layer height (middle column) and associated anomalies on low-Nd days (left column) and high-Nd days (right column). The red box represents sub-domain C-N for which the analysis was conducted.

80 Figure S8: Seasonal averages of vertical pressure velocity at 800 hPa (middle column) and

- 81 associated anomalies on low-N_d days (left column) and high-N_d days (right column). The
- 82 red box represents sub-domain C-N for which the analysis was conducted.
- 83

85 Figure S9: Seasonal averages of relative humidity at 950 hPa (middle column) and

associated anomalies on low-Nd days (left column) and high-Nd days (right column). The red box represents sub-domain C-N for which the analysis was conducted.

145 Figure S21: Average local accumulated effect (ALE) profiles based on GBRT modeling of the following parameters: (a) relative humidity at 950 hPa (RH₉₅₀), (b) relative humidity at 146 800 hPa (RH₈₀₀), (c) rain rate, (d) planetary boundary layer height (PBLH), (e) wind speed 147 at 2 m (Wind_{2m}), and (f) wind direction at 2 m (wind-dir_{2m}). Blue and red profiles represent 148 149 ALEs of DJF and JJA, respectively. Shaded areas show the ALE ranges stemming from the variability of the obtained models from the cross-validation resampling procedure. Markers 150 on the bottom and top x-axes denote the values of 5th, 25th, 50th, 75th, and 95th percentiles for 151 152 each input variable; note that the first three markers on the x-axes in panel (c) are very close 153 and thus on top of each other.

156 Figure S22: Average permutation feature importance of input parameters for (a) DJF and

157 (b) JJA based on GBRT models trained in each season on subsets of data including only

158 samples with low-level liquid cloud fraction greater than or equal to 0.7 (i.e., $CF_{low-liq.} \ge 0.7$).

Feature importance values were calculated based on using the test set. Error bars exhibit the 159 160 range of feature importance values stemming from the variability of the obtained models

161 from the cross-validation resampling procedure.

Figure S23: Average local accumulated effect (ALE) profiles based on GBRT modeling for 164 165 surface mass concentrations of the following parameters: (a) dust, (b) organic carbon, (c) 166 sea-salt, and (d) sulfate. ALE profiles were based on GBRT modeling on subsets of data 167 including only samples with low-level liquid cloud fraction greater than or equal to 0.7 (i.e., 168 $CF_{low-liq} \ge 0.7$). Blue and red profiles represent ALEs of DJF and JJA, respectively. Shaded 169 areas show the ALE ranges stemming from the variability of the obtained models from the 170 cross-validation resampling procedure. Markers on the bottom and top x-axes denote the values of 5th, 25th, 50th, 75th, and 95th percentiles for each input variable. 171

174Figure S24: Same as Figure S23 but for the following input parameters: (a) low-level liquid175cloud fraction ($CF_{low-liq.}$), (b) cloud-top effective height of low-level liquid cloud (cloud-top $_{low-liq.}$), (c) cold-air outbreak (CAO) index, and (d) vertical pressure velocity at 800 hPa (ω_{800}).

179 Figure S25: Same as Figure S23 but for the following input parameters: (a) relative humidity

180 at 950 hPa (RH₉₅₀), (b) relative humidity at 800 hPa (RH₈₀₀), (c) rain rate, (d) planetary
181 boundary layer height (PBLH), (e) wind speed at 2 m (Wind_{2m}), and (f) wind direction at 2

182 **m (wind-dir_{2m}).**

184 Figure S26: Average permutation feature importance of input parameters for (a) DJF and

185 (b) JJA based on GBRT models trained in each season on subsets of data including only

186 samples with low-level liquid cloud fraction between 0.2 and 0.4 (i.e., $0.2 \le CF_{low-liq.} \le 0.4$). 187 Feature importance values were calculated based on using the test set. Error bars exhibit the

range of feature importance values stemming from the variability of the obtained models

189 from the cross-validation resampling procedure.

192 Figure S27: Average local accumulated effect (ALE) profiles based on GBRT modeling for 193 surface mass concentrations of the following parameters: (a) dust, (b) organic carbon, (c) 194 sea-salt, and (d) sulfate. ALE profiles were based on GBRT modeling on subsets of data 195 including only samples with low-level liquid cloud fraction between 0.2 and 0.4 (i.e., $0.2 \leq$ 196 $CF_{low-liq.} \leq 0.4$). Blue and red profiles represent ALEs of DJF and JJA, respectively. Shaded 197 areas show the ALE ranges stemming from the variability of the obtained models from the 198 cross-validation resampling procedure. Markers on the bottom and top x-axes denote the values of 5th, 25th, 50th, 75th, and 95th percentiles for each input variable. 199

Figure S28: Same as Figure S27 but for the following input parameters: (a) low-level liquid
 cloud fraction (CF_{low-liq.}), (b) cloud-top effective height of low-level liquid cloud (cloud-top_{low-liq.}), (c) cold-air outbreak (CAO) index, and (d) vertical pressure velocity at 800 hPa (ω₈₀₀).

Figure S29: Same as Figure S27 but for the following input parameters: (a) relative humidity

at 950 hPa (RH₉₅₀), (b) relative humidity at 800 hPa (RH₈₀₀), (c) rain rate, (d) planetary
boundary layer height (PBLH), (e) wind speed at 2 m (Wind_{2m}), and (f) wind direction at 2
m (wind-dir_{2m}).
