Supplement of

Distinct surface response to black carbon aerosols

Figure S1: Comparison of original $\Delta T$ and fitted $\Delta T$ from the linear regression models. The black thick lines in each plot are one-one lines.
Figure S2: Same as Figure 3 in the main text, but for LTS of 850 hPa and 700 hPa. Positive anomalies indicate more stable atmosphere.
Figure S3: Same as Figure 3 in the main text, but for geopotential height changes at 850 hPa, 700 hPa and 300 hPa.
Figure S4: Same as Fig. 3 in the main text, but for the coupled simulations (near-equilibrium state).
Figure S5: Same as Fig. 4 in the main text, but for the coupled simulations (near-equilibrium state).
Figure S6: Same as Fig. 3 in the main text, but for the slow response, which is obtained by subtracting fast simulations from coupled simulations.
