Supplement of

Effects of prescribed CMIP6 ozone on simulating the Southern Hemisphere atmospheric circulation response to ozone depletion

Figure S1. Latitude-height zonal wind difference between REF and NoODS (a, b and c) and between REF and NoGHG (d, e and f) for October (a and d), November (b and e) and December (c and f) in m s$^{-1}$ (color shading). Stippling masks values that are not significant at the 95% confidence interval. The overlaying contours mark the 1978-2002 climatology of each respective month from REF.
Figure S2. Latitude-height December difference between REF and NoODS in the eddy heat flux (a, in K m s$^{-1}$), the eddy momentum flux (b, in m$^2$s$^{-2}$), the divergence of the EP flux (c, in m s$^{-1}$ day$^{-1}$), the meridional residual velocity (d, in cm s$^{-1}$), the vertical residual velocity (e, in mm s$^{-1}$) and in the dynamical heating rate (f, in K day$^{-1}$) for the period 1978-2002 (color shading). Contours in each panel show the corresponding climatology from REF. Stippling masks values that are not significant at the 95% confidence interval.
Figure S3. Polar stereographic maps of the October 70 hPa temperature trends for the individual members of INTERACT O\textsubscript{3} (a-c) and FIXED O\textsubscript{3} (d-f) in K dec\textsuperscript{-1} for the period 1958-2002 (color shading). The contours show the October climatological temperature in each simulations. Stippling masks regions where the trends are not significant at the 95% confidence level.
Figure S4. Polar stereographic maps of the October (a and b) and November (c and d) 100 hPa trends in SW heating rate for INTERACT O$_3$ (a and c) and FIXED O$_3$ (b and d) in K day$^{-1}$ dec$^{-1}$ for the period 1958-2002. Stippling masks regions where the trends are not significant at the 95% confidence level.
Figure S5. Seasonal cycle of the polar cap (65°S-90°S) temperature trend for the individual members of INTERACT O3 (a-c) and FIXED O3 (e-g) and for IGRA (d) and ERA5 (h) for the period 1958-2002 in K dec⁻¹ (color shading). Stippling masks regions where the trends are not significant at the 95% confidence level. The overlaying contours show the corresponding climatological seasonal cycle. The letter corresponding to each month marks the middle of that month.
Figure S6. Seasonal cycle of the $50^\circ$S-$70^\circ$S zonal wind trend for the individual members of INTERACT O$_3$ (a-c) and FIXED O$_3$ (d-f) for the period 1958-2002 in m s$^{-1}$ dec$^{-1}$ (color shading). Stippling masks regions where the trends are not significant at the 95% confidence level. The overlying contours show the corresponding climatological seasonal cycle. The letter corresponding to each month marks the middle of that month.
Figure S7. Timeseries of INTERACT O$_3$ (a, b) and FIXED O$_3$ (c, d) 100 hPa polar cap (70°S-90°S) temperature (a, c, in K) and SW heating rate (b, d, in K day$^{-1}$) anomalies with respect to the 1958-2013 climatology for each austral spring day.
Figure S8. Latitude-height trends in October (a and b) and November (c and d) dynamical heating rate (in K day$^{-1}$ dec$^{-1}$) in INTERACT O$_3$ (a and c) and FIXED O$_3$ (b and d) for the period 1958-2002 (color shading). Stippling masks the trends that are not significant at the 95% confidence interval. The overlaying contours in each panel show the corresponding climatologies.
