Table S1. EC fractions, OC fractions and speciated organic compounds in $\mathrm{PM}_{2.5}$ samples, including minimum (min.) and maximum (max.), as well as median, mean, $1^{\text {st }}$ and $3^{\text {rd }}$ quartiles (Q1 and Q3).

|  | Abbreviation | Unit | Min. | Q1 | Median | Q3 | Max. | Mean |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Organic Carbon fraction | OC1 | $\mu \mathrm{g} \mathrm{m}{ }^{-3}$ | 0.00 | 0.00 | 0.12 | 0.42 | 1.05 | 0.23 |
| Organic Carbon fraction | OC2 | $\mu \mathrm{g} \mathrm{m}{ }^{-3}$ | 0.38 | 0.64 | 1.21 | 1.87 | 7.07 | 1.73 |
| Organic Carbon fraction | OC3 | $\mu \mathrm{g} \mathrm{m}{ }^{-3}$ | 1.21 | 2.38 | 4.11 | 6.94 | 15.30 | 5.23 |
| Organic Carbon fraction | OC4 | $\mu \mathrm{g} \mathrm{m} \mathrm{m}^{-3}$ | 0.21 | 0.74 | 1.58 | 3.05 | 7.96 | 2.25 |
| Pyrolyzed Organic Carbon | OP | $\mu \mathrm{g} \mathrm{m}{ }^{-3}$ | 0.00 | 0.03 | 0.76 | 2.89 | 8.29 | 1.85 |
| Corrected Element Carbon | EC1-OP | $\mu \mathrm{g} \mathrm{m}{ }^{-3}$ | 0.07 | 0.62 | 1.34 | 3.60 | 15.31 | 2.99 |
| Elemental Carbon fraction | EC2 | $\mu \mathrm{g} \mathrm{m}{ }^{-3}$ | 0.06 | 0.48 | 1.22 | 2.05 | 3.09 | 1.25 |
| Elemental Carbon fraction | EC3 | $\mu \mathrm{g} \mathrm{m} \mathrm{m}^{-3}$ | 0.00 | 0.00 | 0.04 | 0.12 | 0.43 | 0.10 |
| Organic Carbon | OC | $\mu \mathrm{g} \mathrm{m} \mathrm{m}^{-3}$ | 1.82 | 3.73 | 6.57 | 16.0 | 38.33 | 11.1 |
| Elemental Carbon | EC | $\mu \mathrm{g} \mathrm{m}{ }^{-3}$ | 0.13 | 0.83 | 2.05 | 2.98 | 9.80 | 2.41 |
| Eicosanoic acid | A-C20 | $\mathrm{ng} \mathrm{m} \mathrm{m}^{-3}$ | 0.03 | 0.04 | 0.08 | 0.23 | 0.66 | 0.17 |
| Docosanoic acid | A-C21 | $\mathrm{ng} \mathrm{m} \mathrm{m}^{-3}$ | 0.06 | 0.15 | 0.43 | 1.53 | 5.85 | 1.14 |
| Tetracosanoic acid | A-C24 | $\mathrm{ng} \mathrm{m} \mathrm{m}^{-3}$ | 0.05 | 0.23 | 0.76 | 3.00 | 12.46 | 2.25 |
| Pentacosanoic acid | A-C25 | $\mathrm{ng} \mathrm{m} \mathrm{m}^{-3}$ | 0.01 | 0.03 | 0.16 | 0.69 | 3.17 | 0.53 |
| Hexacosanoic acid | A-C26 | $\mathrm{ng} \mathrm{m} \mathrm{m}^{-3}$ | 0.03 | 0.12 | 0.62 | 2.30 | 11.38 | 1.86 |
| Heptacosanoic acid | A-C27 | $\mathrm{ng} \mathrm{m} \mathrm{m}^{-3}$ | 0.00 | 0.01 | 0.10 | 0.44 | 2.25 | 0.36 |
| Octacosanoic acid | A-C28 | $\mathrm{ng} \mathrm{m} \mathrm{m}^{-3}$ | 0.00 | 0.06 | 0.46 | 1.87 | 9.43 | 1.55 |
| Nonacosanoic acid | A-C29 | $\mathrm{ng} \mathrm{m} \mathrm{m}^{-3}$ | 0.00 | 0.02 | 0.04 | 0.37 | 1.85 | 0.30 |

Figure S1. Time series of carbon fractions OC1, OC2, OC3, OC4, OP, EC1-OP, EC2 and EC3 in daily aerosol particle samples ( $\mathrm{n}=20$ ) at PDI during the sampling campaign from 23rd March to $12^{\text {th }}$ April 2015 (see Table S1). Left column provides concentrations of each carbon fraction ( $\mu \mathrm{g} \mathrm{m}^{-3}$ ), and right column provides relative mass fractions within carbonaceous fractions.

Figure S2. Time series of total resolved organic constituents in daily aerosol particle samples ( $\mathrm{n}=20$ ) at PDI during the sampling campaign from $23^{\text {rd }}$ March to $12^{\text {th }}$ April 2015. Left column provides identified mass concentrations ( $\mu \mathrm{g} \mathrm{m}^{-3}$ ), and right column provides relative mass fractions within total class of compounds

Table S2 Concentrations of levoglucosan (LEV) and mannosan (MAN) from Bukowiecki et al. (2019) Aerosol Air Qual. Res. 19(5), 1172-1187, measured by high performance anion exchange chromatography with puked amperometric detection (HPAEC-PAD) from water-extracted quartz fiber filter samples.

| Date in 2015 | Levoglucosan | Mannosan | LEV/MAN |
| :---: | :---: | :---: | :---: |

Figure S3. Mass ratios of syringic acid (SYAH) to vanillic acid (VAH, circles) and syringic acid (SYAH) to syringaldehyde (SYA, triangles). Colors correspond to days with low (blue), medium (black) and high BBinfluence (red).

Figure S4. Carbon number of most abundant n-alkane ( $\mathrm{C}_{\text {max }}$; bars) and Carbon Preference Index (CPI) using n-alkanes from $\mathrm{C}_{21} \mathrm{H}_{44}$ to $\mathrm{C}_{32} \mathrm{H}_{66}\left(\mathrm{CPI}_{21-32}\right.$; circles). Colors correspond to days with low (blue), medium (black) and high BB-influence (red).

Figure S5. Illustration of concentrations of total anhydrosugars (AS) vs individual fatty acids and total fatty acids. Colors correspond to days with low (blue), medium (black) and high BB-influence (red). Linear regression functions (black lines) were obtained only from including days of low and medium BB-influence.

Figure S6. PAH diagnostic ratios to estimate a) the contribution of pyrogenic PAH and b) the influence of atmospheric aging. Colors denote the previously defined periods with low (blue), medium (black) and high (red) influence of BB. Dot sizes represent a relative metric for the total concentration of PAH involved in the respective diagnostic ratio. The gray-shaded area illustrates more PAH of pyrogenic origin and more atmospheric ally aged particles towards darker gray.

Figure S7. Illustration of concentrations of total anhydrosugars (A) vs total concentration 4- to 7-ring PAH. Colors correspond to days with low (blue), medium (black) and high BB-influence (red). Deming regression functions were obtained either only from including days of low and medium BB-influence (black solid line) or all data (black dashed line). Intercepts and slopes of the two fits are not significantly different at a signific ance level of $5 \%$.

Figure S8. Illustration of concentrations of total anhydrosugars (AS) vs individual o-PAH 9,10anthracenedione ( $9,10-\mathrm{AN}$ ) and the sum of naphthalic anhydride (NAP-AN) and naphthalic acid (NAP-AC). Colors correspond to days with low (blue), medium (black) and high BB-influence (red). Deming regression functions (black lines) were obtained by only including days of low and medium BB-influence (without days of high BB-influence).

Figure S9. Illustration of concentrations of total anhydrosugars vs individual nitrophenols 4-nitrophenol (4NP ), 4-nitrocatechol (4-NC) and 2,6-dimethoxy-4-nitrophenol (2,6-D-4-NP). Colors correspond to days with low (blue), medium (black) and high BB-influence (red). Deming regression functions (black lines) were obtained by only including days of low and medium BB-influence (without days of high BB-influence).

Figure S10. a) Hourly excess ratio between $\mathrm{O}_{3}$ and $\mathrm{CO}\left(\Delta \mathrm{O}_{3} /(\Delta \mathrm{CO})\right.$ ranged between $0.00-1.00$. b) Hourly modified combustion effic iency (MCE: $\Delta \mathrm{CO}_{2} /\left(\Delta \mathrm{CO}+\Delta \mathrm{CO}_{2}\right)$ ratios ranged between $0.80-1.00$ at PDI during the sampling campaign from $23^{\text {rd }}$ March to $12^{\text {th }}$ April 2015. Colors denote the previously defined periods with low (blue), medium (black) and high (red) influence of BB.

Table S3. Fit coefficients for Deming regression of concentration $=a \cdot M C E+b$ (Figure 8 ) and their uncertainty by means of one standard deviation obtained from 500 Monte Carlo runs.

| Compound class | Slope $\left.\mathrm{ang} \mathrm{m}^{-3}\right]$ | Intercept b $\left[\mathrm{ng} \mathrm{m}^{-3}\right]$ |
| :--- | :--- | :--- |
| Anhydrosugars | $-4.30 \mathrm{e} 4 \pm 1.39 \mathrm{e} 4$ | $4.25 \mathrm{e} 4 \pm 1.36 \mathrm{e} 4$ |
| Fatty acids | $-1.31 \mathrm{e} 3 \pm 420$ | $1.30 \mathrm{e} 3 \pm 410$ |
| Methoxyphenols | $-8.68 \mathrm{e} 3 \pm 2.70 \mathrm{e} 3$ | $8.58 \mathrm{e} 3 \pm 2.67 \mathrm{e} 3$ |
| Nitrophenols | $-1.48 \mathrm{e} 4 \pm 5.04 \mathrm{e} 3$ | $1.46 \mathrm{e} 4 \pm 4.89 \mathrm{e} 3$ |
| n-alkanes | $-5.90 \mathrm{e} 3 \pm 5.04 \mathrm{e} 3$ | $5.85 \mathrm{e} 3 \pm 4.89 \mathrm{e} 3$ |
| PAHs | $-41.8 \pm 14.0$ | $41.8 \pm 13.7$ |
| o-PAHs | $-337 \pm 101$ | $332 \pm 99$ |
| OC | $-844 \mathrm{e} 3 \pm 268 \mathrm{e} 3$ | $836 \mathrm{e} 3 \pm 263 \mathrm{e} 3$ |

Figure S11. Ten-day backward trajectories arriving at PDI; the sub-periods were determined by the organic aerosol clustering 23-30 March (n=8, light blue), 31st March- 4th April + 7th April (n=6, black), 5th and 6th April ( $\mathrm{n}=2$, red), and 8th -12 th April ( $\mathrm{n}=6$, dark blue). The upper panels display the average height of the trajectories above sea level against time. The lower panel gives the average location of the trajectories overlaid on a map of MODIS fire count densities for the period five days before the beginning of each sub-period until the end of each sub-period (from low (bright yellow) to high (orange-red) fire intensities).
