**Figure S1.** Meteorological conditions during the campaign.

**Figure S2.** Size-dependently effective density of the BC core for thinly-coated BC particles.
Figure S3. Comparison between optical diameter and mobility diameter for (a) thinly-coated BC and (b) thickly-coated BC.

Figure S4. Time series of the aerosol mass concentrations of different chemical species.

Figure S5. Temporal variation of biomass burning tracers during the observation.
**Figure S6.** Diurnal variation of absolute humidity (water vapor concentration) and wind speed during Period I and Period II. The solid dots are the mean values. The rectangles cover the data from 25% to 75% quantile. The short lines in the middle of the rectangles represent the median values.
