Supplement of

Impact of international shipping emissions on ozone and PM$_{2.5}$ in East Asia during summer: the important role of HONO and ClNO$_2$

\(^a\) OBS represents the hourly averages for the available observational data (over the entire regions for the meteorological parameters and over China for the air pollutants). SIM represents the simulated data from BASE case.

\(^b\) Mean Bias (MB) = \(\frac{\sum_{i=1}^{n}(x_i-y_i)}{n}\); Normalized Mean Bias (NMB) = \(\frac{\sum_{i=1}^{n}(Sim_i-Obs_i)}{Obs_i}\); Normalized Mean Errors (NME) = \(\frac{\sum_{i=1}^{n}|Sim_i-Obs_i|}{Obs_i}\); \(R\) = \(\frac{\sum_{i=1}^{n}(x_i-\bar{x})(y_i-\bar{y})}{\sqrt{\sum_{i=1}^{n}(x_i-\bar{x})^2 \sum_{i=1}^{n}(y_i-\bar{y})^2}}\); \(n\) is the number of hour.

\(^c\) Observational data was obtained from the National Climate Data Center (NCDC). WS\(_{10}\): wind speed at 10 m; T\(_2\): temperature at 2 m; RH: specific humidity at 2 m.

\(^d\) Observational data was obtained from China’s Ministry of Ecology and Environment (MEE).

$^a$ Observed data was filtered with one-day backward trajectory from ocean.
Figure S1. Measurement sites. (a) Blue dots denote the surface weather stations in NCDC in July 2018. (b) Red dots denote the available surface air-quality monitoring stations operated by MEE in July 2018.
Figure S2. (a) Observations of O₃ at China MEE station and two marine sites in Japan and modeled O₃ mixing ratios with (b) default chemistry and (c) integrated HONO and chlorine chemistry (Unit: ppbv). The red circles in (b) and (c) highlight the O₃ simulation in coastal areas.
Figure S3. Vertical distribution of averaged (a)(b) HONO (Unit: ppbv) and (c)(d) nighttime ClNO₂ (Unit: pptv) at cross-section by 113°E and 31°N, respectively in July 2018 from the BASE case. Arrows and the gray shadow present the topography high from the BASE case. We also highlight the South China Sea (SCS) and Pearl River Delta (PRD) in (a) and Yangzi River Delta (YRD) and East China Sea (ECS) in (b).
Figure S4. Spatial distribution of averaged N₂O₅ (Unit: pptv) during nighttime (18:00-06:00 LST) at the surface from the BASE case in July 2018. Arrows present the simulated wind vectors from the BASE case.
Figure S5. Spatial distribution of averaged fine particulate chloride (Unit: μg m\(^{-3}\)) at the surface from the BASE case in July 2018. Arrows present the simulated wind vectors from the BASE case.
**Figure S6.** Average variation of simulated (a) OH radical (Unit: pptv) during daytime from the ship emission with additional HONO chemistry (HONO - HONO_noship) and (b) Cl radical (Unit: $10^{-9}$ pptv) during daytime from the ship emission with chlorine chemistry (Cl - Cl_noship).
Figure S7. Vertical profiles of O$_3$ variations (Unit: ppbv) from different chemistry in nine regions.
Figure S8. Averaged fine particulate nitrate enhancement (Unit: μg m$^{-3}$) with (a) default chemistry (Def-Def_noship), (b) default and additional HONO chemistry (HONO-HONO_noship), (c) default and additional chlorine chemistry (Cl-Cl_noship) and (d) default and integrated HONO and chlorine chemistry (BASE-BASE_noship). Arrows present the simulated wind vectors from the BASE case.
Figure S9. Averaged fine particulate sulfur enhancement (Unit: μg m$^{-3}$) with (a) default chemistry (Def-Def_noship), (b) default and additional HONO chemistry (HONO-HONO_noship), (c) default and additional chlorine chemistry (Cl-Cl_noship) and (d) default and integrated HONO and chlorine chemistry (BASE-BASE_noship). Arrows present the simulated wind vectors from the BASE case.
Figure S10. Contribution of ship emission to the concentration of detailed aerosol species in oceanic areas and coastal cities. PSO4, PNO3, PNH4 and PPM represent the fine particulate sulfate, fine particulate nitrate, fine particulate ammonia, and primary particulate matter, respectively. Def_ship and ReNOM_ship represents Def-Def_noship and BASE-BASE_noship, respectively.
