*regression line excluding one outlier; $Y = 0.98x - 0.06$, $R^2 = 1.00$

Figure S1: Scatter plots comparing atmospheric gas (NH₃, HNO₃, SO₂ and HCl) and aerosol (NH₄⁺, NO₃⁻, SO₄²⁻, Cl⁻, Na⁺, Ca²⁺, Mg²⁺) concentrations measured by each of the NEU laboratories with the median estimate of all laboratories for field inter-comparisons conducted between 2007 – 2009 only. Data from the 2006 inter-comparisons are excluded in this analysis, to compare with Figure 6 in main text which included all periods. A summary of the regression results is shown in the table below the graphs. Note (i) There are fewer data points for INRAE because they joined the NEU network later in 2007 and participated in the 2008 and 2009 inter-comparisons only. (ii) Low number of observations in some cases were due to some laboratories not reporting all parameters. NILU: HCl, Cl⁻, Na⁺, Ca²⁺ and Mg²⁺ reported for 2008 inter-comparisons only.

^aEquivalent aerosol concentrations, based on air volume of 7.5 m³ sampled by DELTA® system over a 2-week exposure period in the 2006 DELTA intercomparison.

Figure S2: Comparison of laboratory and field blanks (where reported) for ammonium aerosol filters from the 2006 DELTA[®] intercomparison exercise between six participating laboratories.

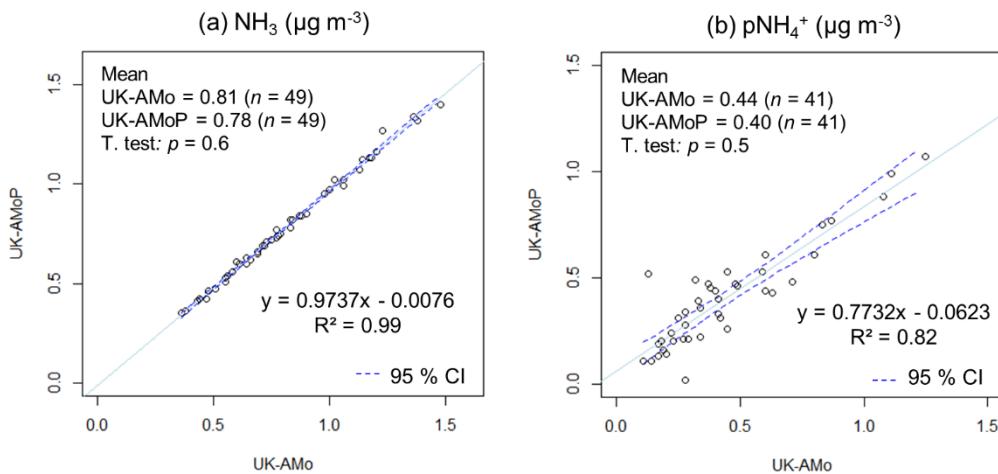

Figure S3: Comparison of replicated DELTA monthly measurement of (a) NH_3 and (b) particulate NH_4^+ concentrations at the UK Auchencorth (UK-AMo) and its' parallel site (UK-AMoP). Months where paired data are not available were excluded from analysis. Independent samples t test was carried out using R. $p < 0.05$ = statistically significant difference in mean concentration between replicated measurements. $p > 0.05$ = not a statistically significant difference.

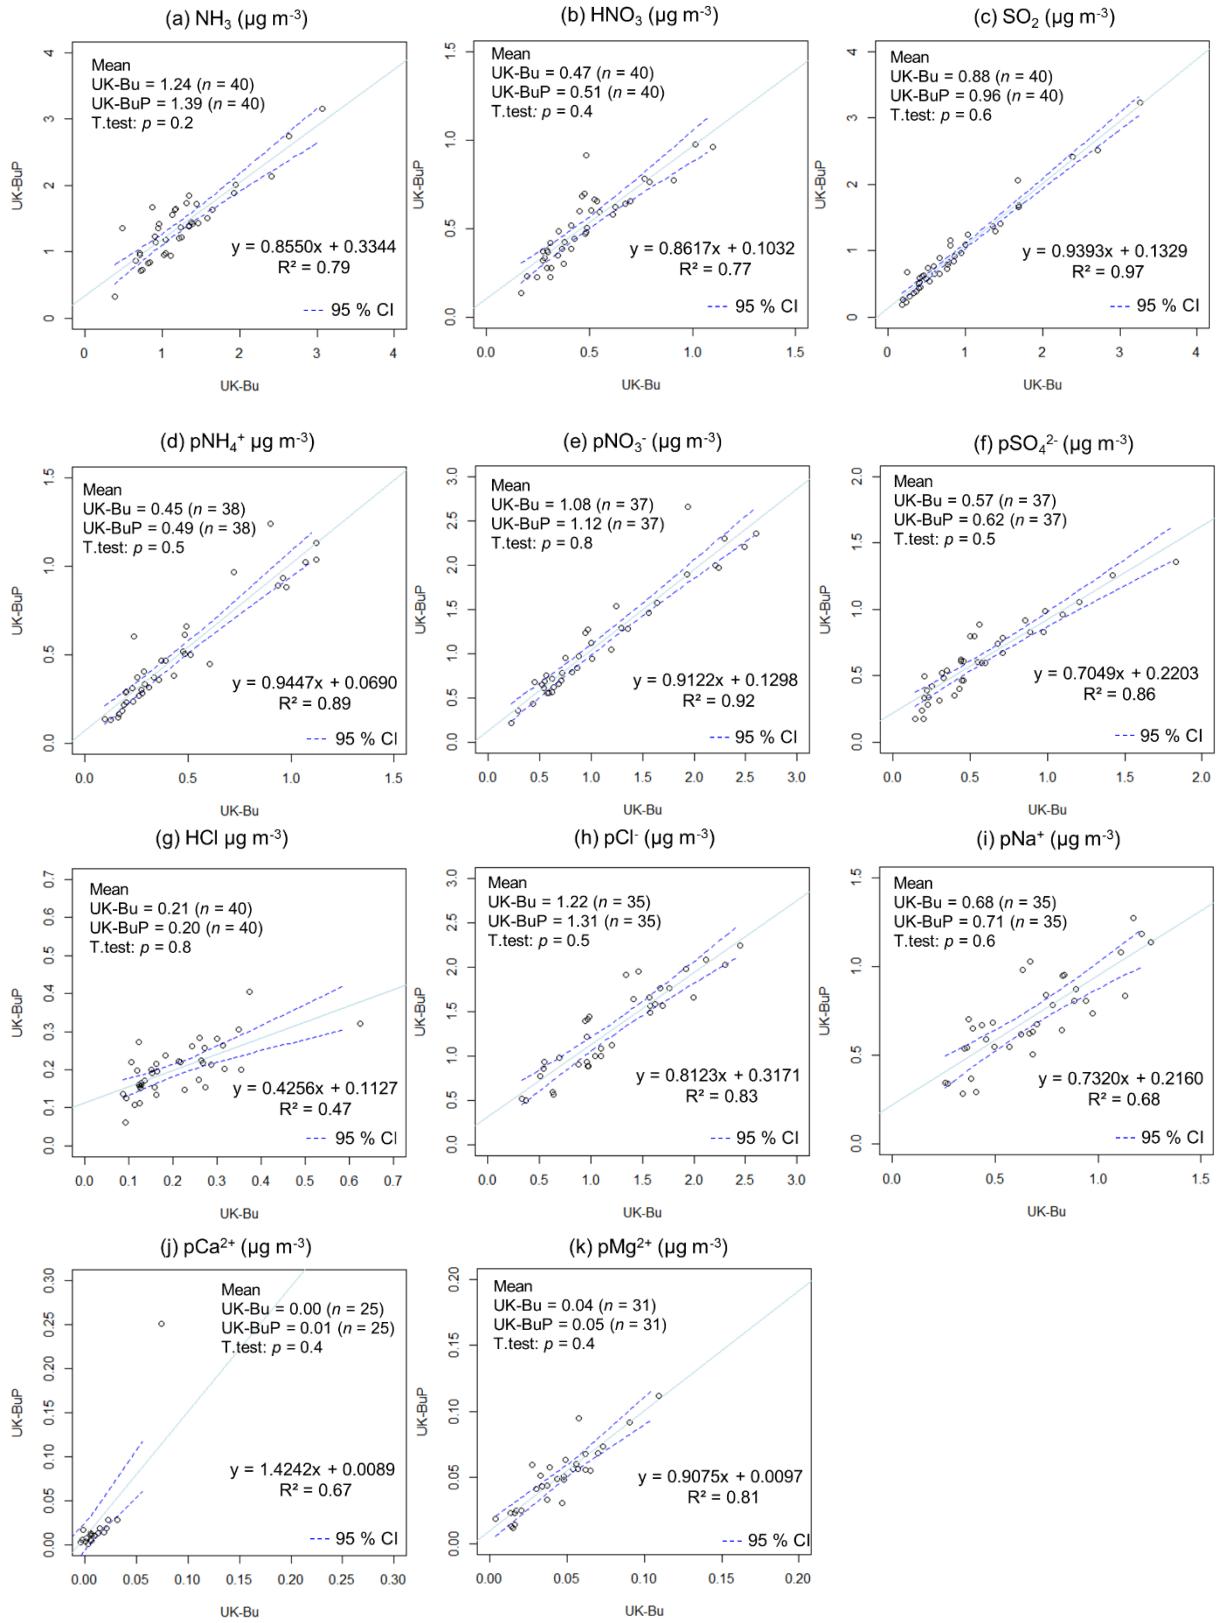

Figure S4: Comparison of replicated DELTA monthly measurement of gases (a: NH_3 , b: HNO_3 , c: SO_2 , g: HCl) and particulates (d: NH_4^+ , e: NO_3^- , f: SO_4^{2-} , h: Cl^- , i: Na^+ , j: Ca^{2+} , k: Mg^{2+}) at the UK Bush site (UK-Bu) and its' parallel site (UK-BuP). Independent samples t test was carried out on R ($p < 0.05$ = statistically significant difference in mean concentration between the replicates; $p > 0.05$ = not a statistically significant difference).

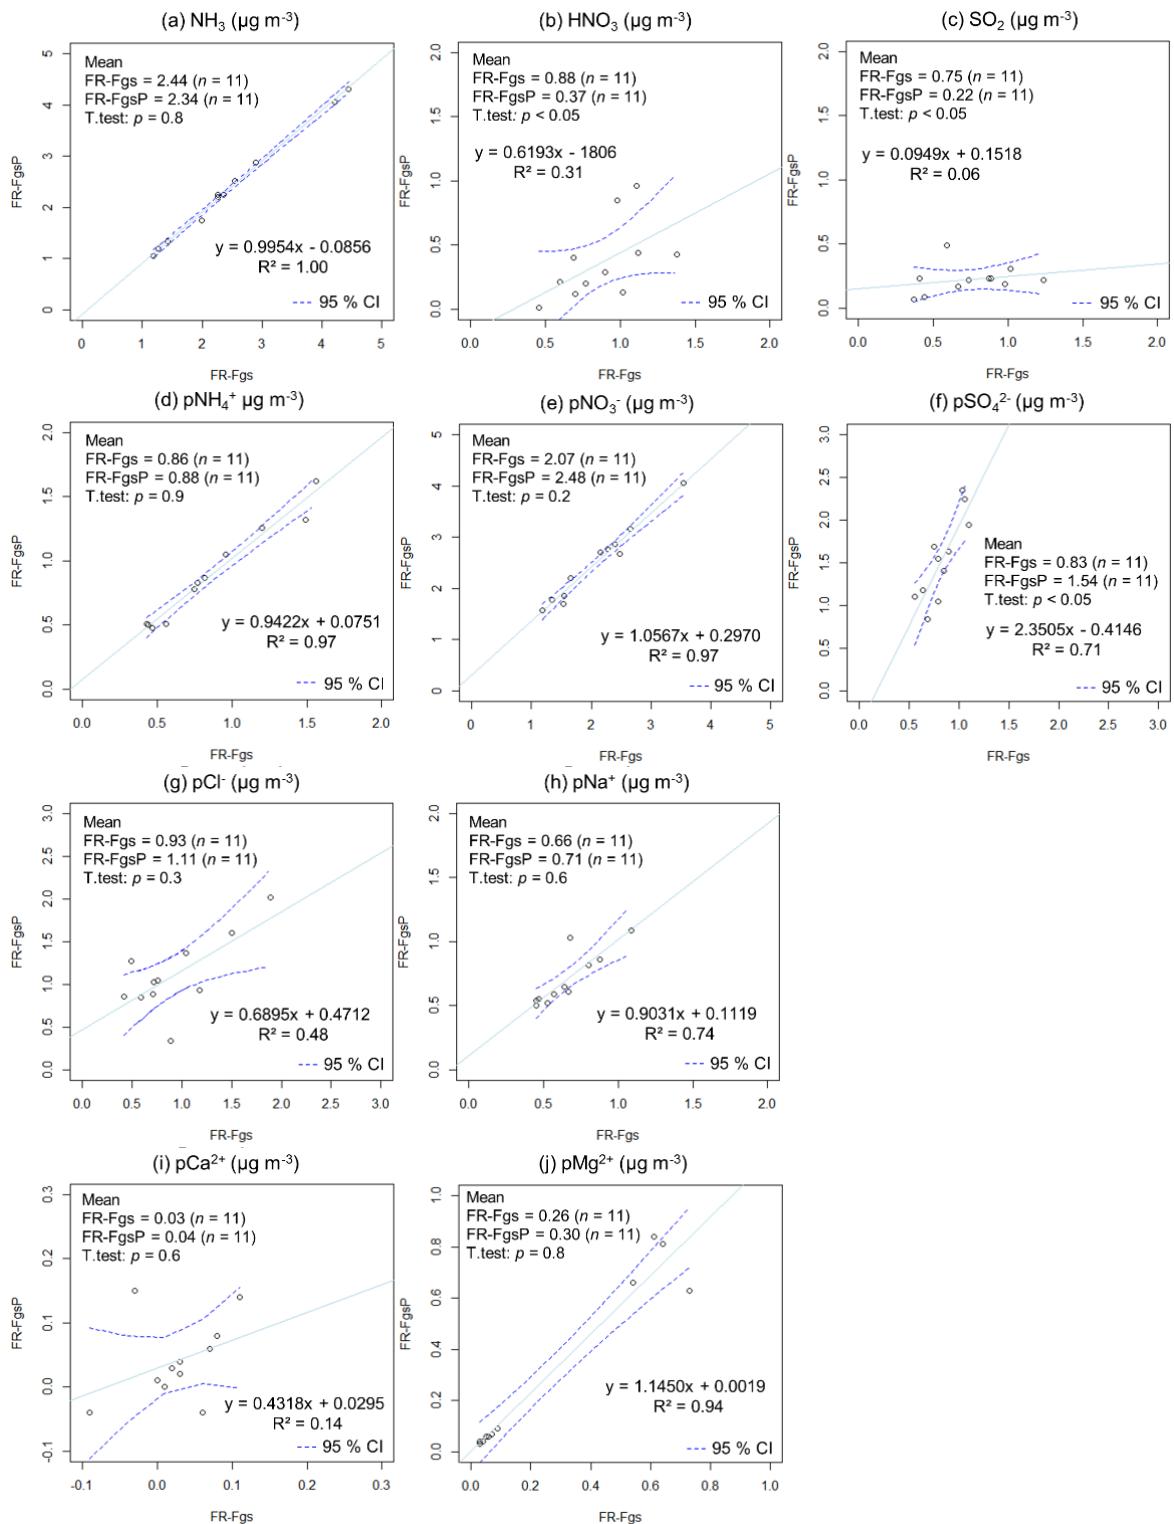

Figure S5: Comparison of replicated DELTA monthly measurement of gases (a: NH_3 , *b: HNO_3 , **c: SO_2) and particulates (d: NH_4^+ , e: NO_3^- , **f: SO_4^{2-} , g: Cl^- , h: Na^+ , i: Ca^{2+} , j: Mg^{2+}) at the French Fougères site (FR-Fgs) and its' parallel site (FR-FgsP). Independent samples t-test was carried out on R ($p < 0.05$ = statistically significant difference in mean concentration between the replicates; $p > 0.05$ = not a statistically significant difference).

* K_2CO_3 /glycerol coated denuder used at FR-Fgs (HNO_3 determination includes potential interference from co-collected oxidised N species) vs NaCl coated denuder at FR-FgsP (selective for HNO_3). ** SO_2 is partially captured on NaCl coated denuders only, with break-through of SO_2 onto the aerosol filters resulting in larger particulate SO_4^{2-} concentrations than the Fr-Fgs site.

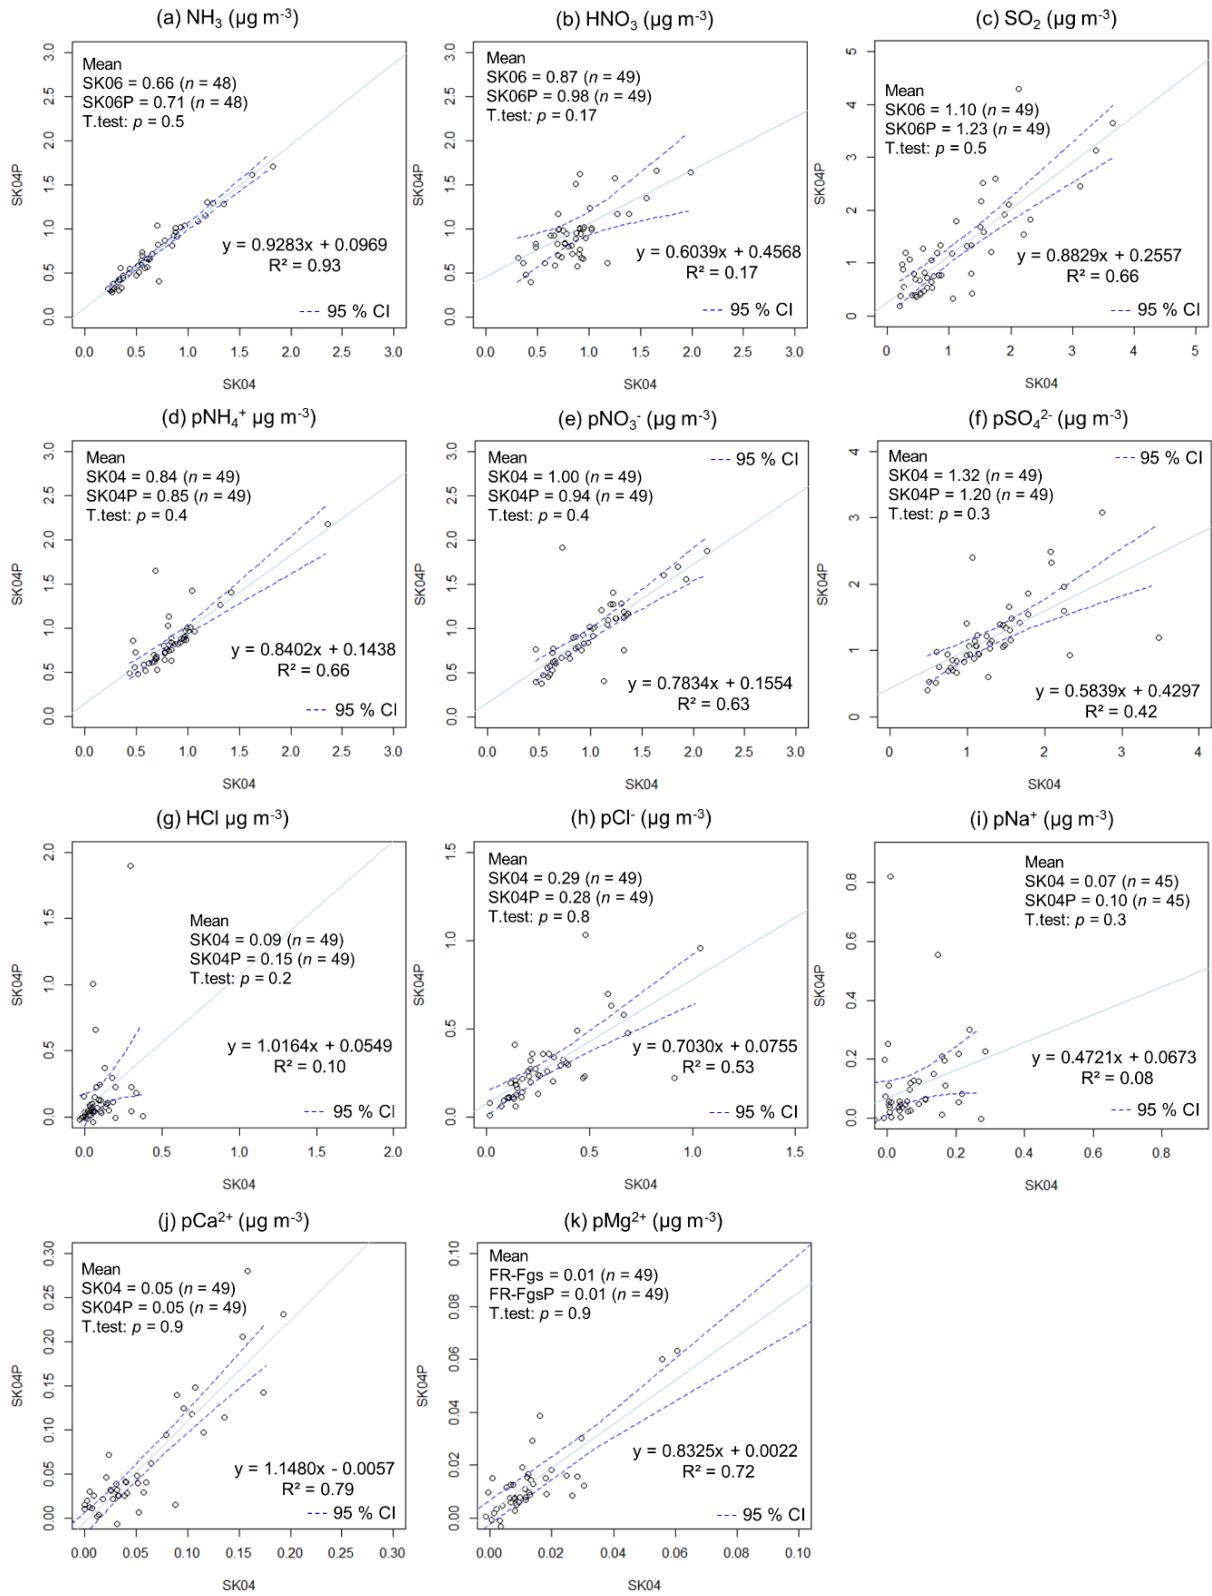

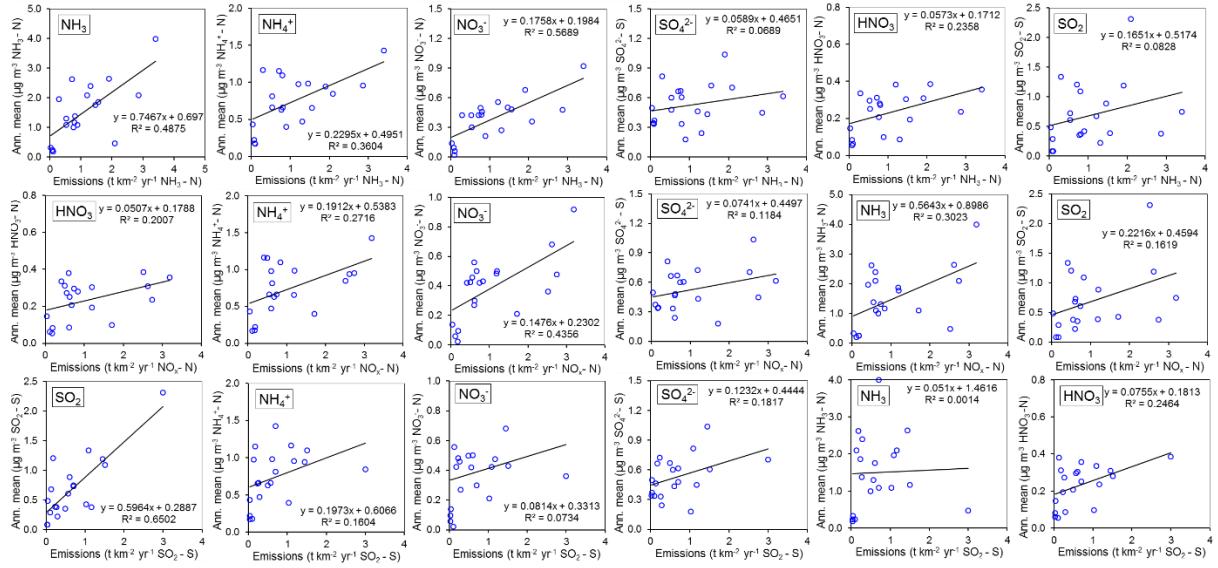

Figure S6: Comparison of replicated DELTA monthly measurement of gases (a: NH_3 , b: HNO_3 , c: SO_2 , g: HCl) and particulates (d: NH_4^+ , e: NO_3^- , f: SO_4^{2-} , h: Cl^- , i: Na^+ , j: Ca^{2+} , k: Mg^{2+}) at the Slovakian site (SK06) and its parallel site (SK06P). Independent samples t test was carried out on R ($p < 0.05$ = statistically significant difference in mean concentration between the replicates; $p > 0.05$ = not a statistically significant difference).

Figure S7:(TOP) Scatter plots and (BOTTOM) summary statistics of regression analyses between national annual averaged gas (NH₃, HNO₃, SO₂) and aerosol (NH₄⁺, NO₃⁻, SO₄²⁻) concentrations, and the national emission densities of NH₃-N (upper plots), NO_x-N (middle plots) and SO₂-S (lower plots) (expressed as emissions per unit area of the country per year, averaged over the 4-year period 2007 to 2010) for each of the 20 countries in the NEU DELTA® network.

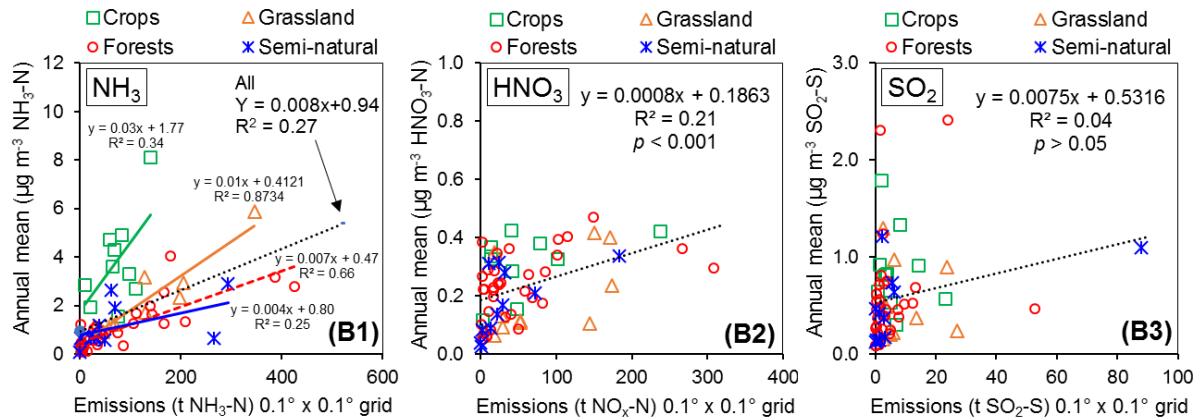

Figure S8: Regression plots of annual averaged gas (NH_3 , HNO_3 , SO_2) concentrations (2007 – 2010) at each site in the NEU DELTA® network vs 4-year averaged total emissions of gases (NH_3 , NO_x and SO_2 : tonnes yr^{-1}) from single EMEP grids ($0.1^\circ \times 0.1^\circ$) in which each site is located ($n = 66$). Coloured symbols indicate the ecosystem classification of each site (Crops, $n = 10$; Grassland, $n = 10$; Forests, $n = 35$ and Semi-natural, $n = 11$).

Comparisons with gridded emissions

The comparisons in the manuscript used national emission totals, where emissions have been summed and averaged across very large and heterogeneous areas in each country. Another approach is to compare the individual site mean data with gridded emissions from individual $0.1^\circ \times 0.1^\circ$ EMEP grids in which the NEU sites are located. This also provided significant correlations for NH_3 ($p < 0.001$, $n = 66$, Figure S8B1) and HNO_3 vs NO_x ($p < 0.05$, Figure S8B2), but not for SO_2 (Figure S8B3, Figure SS9). Some interesting features also emerged in the NH_3 comparisons, with clustering of data according to ecosystem types (Figure 10B1). The cropland sites have highest NH_3 concentrations compared with gridded emissions (slope = 0.03, $R^2 = 0.34$, $p = 0.08$, $n = 10$), followed by grassland sites (slope = 0.01, $R^2 = 0.87$, $p < 0.001$, $n = 10$) (Fig. S8B1, Figure S9). Forest (slope = 0.007, $R^2 = 0.87$, $p < 0.001$, $n = 35$) and semi-natural sites (slope = 0.004, $R^2 = 0.25$, $p = 0.11$, $n = 11$) are similar, with smaller NH_3 concentrations compared with their gridded emissions. Since NH_3 is spatially heterogeneous even at a local sub-grid scale (e.g. Dragosits et al., 2002), the smaller concentrations at semi-natural and forest sites in grids with large emissions indicates these sites may be located further away from sources in the grid (Tang et al., 2018; van Zanten et al., 2017). Dry deposition of NH_3 is also largest to forests and semi-natural areas (larger V_d than to crops/grass ecosystem types, e.g. Smith et al., 2000; Flechard et al., 2011), which could also contribute to the smaller concentrations at higher emissions. Relationship between emissions and concentrations in the atmosphere is however complex, influenced by other factors such as chemical interactions, variations in meteorological conditions and long-range transboundary import.

The lack of correlation between SO_2 concentrations and gridded emissions (Figure S8B3) suggests that a $0.1^\circ \times 0.1^\circ$ grid may be too local a spatial scale for an emission-concentration comparison for SO_2 , as SO_2 is likely to be highly localised with emissions occurring from a smaller number of large point sources at an elevated height. Indeed, emissions in neighbouring grids surrounding each site are highly variable. For example, the 4-year averaged SO_2 emissions in the 4 EMEP grids around the Italian San Rossore site (IT-SRo) varied between 0.47 to 610 kt SO_2 yr^{-1} . Further analysis was also carried out comparing site mean concentrations against the averaged emissions of an extended number of EMEP grids (4 x grids) (Supp. Figure S4). Since the analysis provided similar results to the comparisons with individual gridded emissions, they are not included for further discussions in this main paper, but are provided here for information.

Table S7: Summary statistics for replicated measurements of reactive gases(NH_3 , HNO_3 , SO_2 , HCl) and aerosols (NH_4^+ , NO_3^- , SO_4^{2-} , Cl^- , Na^+ , Ca^{2+} , Mg^{2+}) concentrations at the French Fougères (FR-Fgs) and parallel site (FR-FgsP) in the NEU DELTA® network.

Year	Gas: NH_3						Particle: NH_4^+					
	FR-Fgs		FR-FgsP		Difference		FR-Fgs		FR-FgsP		Difference	
Mean	n	Mean	n			Mean	n	Mean	n			
2010	2.44	11	2.34	11	4.1%		0.86	11	0.88	11	-2.3%	
Gas: HNO_3												Particle: NO_3^-
2010	0.88	11	0.37	11	58%		2.07	11	2.48	11	-19.8%	
Gas: SO_2												Particle: SO_4^{2-}
2010	0.75	11	0.22	11	71%		0.83	11	1.54	11	-86%	
Gas: HCl												Particle: Cl^-
2010	0.93	11	-	-	-		0.93	11	1.11	11	-19%	
Particle: Na^+												Particle: Ca^{2+}
2010	0.66	11	0.71	11	-7.6%		0.03	11	0.04	11	-33%	
Particle: Mg^{2+}												
2010	0.26	11	0.30	11	-15%							

Note: NaCl coated denuders were used instead of K_2CO_3 /glycerol coated denuders at the FR-FgsP parallel site. Results for the acid gases (HNO_3 , SO_2) and particulates (NO_3^- , SO_4^{2-}) are therefore not directly comparable, while NaCl cannot be determined on NaCl coated denuders.

Table S8: Summary statistics for replicated measurements of reactive gases(NH_3 , HNO_3 , SO_2 , HCl) and aerosols (NH_4^+ , NO_3^- , SO_4^{2-} , Cl^- , Na^+ , Ca^{2+} , Mg^{2+}) concentrations at the Slovakian EMEP (SK04) and parallel site (SK04P) in the NEU DELTA® network.

Table S19: Annual wet deposition of inorganic components ($\text{kg ha}^{-1} \text{yr}^{-1}$) estimated from Rotenkamp bulk precipitation collectors in the NEU bulk wet deposition network and percentage composition by mass measured. The data shown are 2-year averaged deposition, made between 2008 and 2010, except at 5 sites with 1 year of measurement only (BE-Vie, FR-Fgs, FR-LBr, DE-Wet, IT-BCi).

Site ID / Ecosystem type		Annual Wet Deposition ($\text{kg ha}^{-1} \text{yr}^{-1}$)										% contribution to total (by mass)
