

Supplement of

A seasonal analysis of aerosol NO_3^- sources and NO_x oxidation pathways in the Southern Ocean marine boundary layer

Jessica M. Burger et al.

Supplemental material

Table S1. The start and end date of each filter deployment, as well as the latitude (° N) and Longitude (° E) at the start and end of each filter deployment are presented. The duration (hr) of each filter deployment and the number of daylight hours experienced during each filter deployment is also included, and samples are separated by season (Winter, Spring and Summer) and by transect (Southbound, Northbound or Ice edge).

Table S2. Accepted reference values for $\delta^{15}N$ vs. N_2 in air and $\delta^{18}O$ vs. VSMOW in ‰ for the calibration standards used.

Standard	IAEA-N3	USGS34	USGS35	Citation
δ ¹⁵ N	4.7	-1.8		Böhlke et al., 2003
δ ¹⁸ Ο	25.6	-27.9	57.5	Böhlke et al., 2003

Table S3. The pooled standard deviation in ∞ and samples size (1 SD_p; n = x) for repeated measurements of reference standards in winter & spring.

Season	Standard	IAEA-N3	USGS34	USGS35
winter & spring	δ ¹⁵ N	0.32; n = 19	0.16; n = 19	
winter & spring	δ ¹⁸ Ο	0.26; n = 19	0.64; n = 19	0.52, n = 19

Figure S1. 120 hour AMBTs (grey) computed for each hour of the research voyage conducted in winter, spring and summer respectively. Red circles denote the location of the ship at each hour and represent the cruise track.

Figure S2. 72-hour AMBTs computed for each hour of the first filter deployment made in winter on both the southbound (Winter S). Red triangles indicate the ships cruise track during the filter deployment. The AMBTs are coloured by height (m) (blue to green colour bar).

Figure S3. The number of daylight hours (h) available during each filter deployment in winter (blue diamonds), spring (green squares) and summer (orange circles), with latitude (⁰ S).

Figure S4. 72-hour AMBTs computed for each hour of the winter cruise during the southbound leg (a), the northbound leg (b) when the HV-AS was running for more than 45 min of the hour. AMBTs are colour coded by the weighted average δ^{15} N-NO₃⁻, represented by the blue to red colour bar. Overlaid are the surface ocean nitrite concentrations ([NO₂⁻]), represented by the green colour bar. The white area represents the location of the sea ice determined using satellite-derived sea ice concentration data obtained from the passive microwave sensors ASMR2 (Advanced Microwave Scanning Radiometer2; Spreen et al., 2008).

Figure S5. The correlation between atmospheric δ^{18} O-NO₃⁻ and Δ^{17} O-NO₃⁻ in winter (blue diamonds) and spring (green squares). The best fit equations and coefficients of determination (R²) for δ^{18} O-NO₃⁻ vs. Δ^{17} O-NO₃⁻ are shown.

Figure S6. Daily averaged wind speed (a) and air temperature (b) for summer (orange circles), winter (blue diamonds) and spring (green squares), respectively.
