## Text S1. The derivation of the $\log K^{\prime}{ }^{\prime}$ for LMW SVOCs based on the new steadystate G-P partitioning model

The gas-particle (G-P) partitioning quotient ( $K_{\mathrm{P}} \mathbf{\prime}^{\prime}$ ) can be calculated as follows:

$$
\begin{equation*}
K_{\mathrm{P}}^{\prime}=\left(C_{\mathrm{P}} / C_{\mathrm{G}}\right) / T S P \tag{S1}
\end{equation*}
$$

where, $C_{\mathrm{P}}\left(\mathrm{ng} / \mathrm{m}^{3}\right.$ air $)$ and $C_{\mathrm{G}}\left(\mathrm{ng} / \mathrm{m}^{3}\right)$ are the concentrations of SVOCs in particle phase and gas phase, respectively, and $T S P$ is the concentrations of total suspended particles $\left(\mu \mathrm{g} / \mathrm{m}^{3}\right)$.
$C_{\mathrm{P}}$ can be transferred to $C_{\mathrm{P}}^{\prime}\left(\mathrm{ng} / \mathrm{m}^{3}\right.$ particle) based the following equation:

$$
\begin{equation*}
C_{\mathrm{P}}=C_{\mathrm{P}}^{\prime} \times T S P / 10^{9} \rho_{\mathrm{P}} \tag{S2}
\end{equation*}
$$

where, $C^{\prime}{ }_{P}\left(\mathrm{ng} / \mathrm{m}^{3}\right.$ particle) is the concentrations in particle phase with different units, and $\rho_{\mathrm{P}}$ is the density of particles $\left(\mathrm{kg} / \mathrm{m}^{3}\right)$.

Then, the Eq. (S1) can be expressed in different form:

$$
\begin{equation*}
K_{\mathrm{P}}^{\prime}=\left(C_{\mathrm{P}}^{\prime} / C_{\mathrm{G}}\right) / 10^{9} \rho_{P} \tag{S3}
\end{equation*}
$$

The ratio of $C^{\prime}{ }_{\mathrm{P}}$ to $C_{\mathrm{G}}$ can be calculated using the method from the multimedia fugacity model:

$$
\begin{equation*}
C_{\mathrm{P}}^{\prime} / C_{\mathrm{G}}=f_{\mathrm{P}} Z_{\mathrm{P}} / f_{\mathrm{G}} Z_{\mathrm{G}} \tag{S4}
\end{equation*}
$$

where, $f_{\mathrm{P}}$ and $f_{\mathrm{G}}$ are the fugacity for particle phase and gas phase, respectively, $Z_{\mathrm{P}}$ and $Z_{\mathrm{G}}$ are the fugacity capacity for particle phase and gas phase, respectively.
$Z_{\mathrm{P}} / Z_{\mathrm{G}}$ equal to $K_{\mathrm{PG}}$ at equilibrium state, which can be calculated by the following equation (Li et al., 2015):

$$
\begin{equation*}
K_{\mathrm{PG}}=Z_{\mathrm{P}} / Z_{\mathrm{G}}=10^{9} \rho_{P} K_{\mathrm{P}-\mathrm{HB}} \tag{S5}
\end{equation*}
$$

where, $K_{\mathrm{P}-\mathrm{HB}}$ is the G-P partitioning coefficient calculated from the $\mathrm{H}-\mathrm{B}$ model (the equilibrium-state model) (Harner and Bidleman, 1998).

Summarizing the equations above, $\log K_{\mathrm{P}}$ can be expressed as following equation:

$$
\begin{equation*}
\log K_{\mathrm{P}}^{\prime}=\log K_{\mathrm{P}-\mathrm{HB}}+\log \left(f_{\mathrm{P}} / f_{\mathrm{G}}\right) \tag{S6}
\end{equation*}
$$

According to the Eq. (5), $K_{\mathrm{P}}$ will upward deviate from $K_{\mathrm{P}-\mathrm{HB}}$ (or the equilibrium state) when $f_{\mathrm{P}}>f_{\mathrm{G}}$. Based on our previous study (Zhu et al., 2023), the fugacity ratio of
the particle phase to the gas phase can be expressed as Eq. (S7), when the steady state is reached between gas phase and particle phase:

$$
\begin{equation*}
\frac{f_{\mathrm{P}}}{f_{\mathrm{G}}}=\frac{D_{\mathrm{GP}}+\phi_{0} D_{\mathrm{GR}}}{D_{\mathrm{GP}}+\left(1-\phi_{0}\right)\left(D_{\mathrm{PD}}+D_{\mathrm{PW}}\right)} \tag{S7}
\end{equation*}
$$

where, $\phi_{0}$ is the particulate proportion of SVOCs in emission; $D_{\mathrm{GP}}$ is the intermedia $D$ value between gas phase and particle phase; $D_{\mathrm{GR}}$ is the $D$ value for the degradation of gas-phase SVOCs; $D_{\mathrm{PD}}$ and $D_{\mathrm{PW}}$ are the $D$ values of the dry and wet depositions of particle-phase SVOCs, respectively.

For the LMW SVOCs, the dry and wet deposition fluxes of particle phase ( $F_{\mathrm{PD}}+$ $F_{\text {PW) }}$ (Fig. S5) can be ignored (Li et al., 2015; Zhu et al., 2023), then the Eq. (S7) can be expressed as follows:

$$
\begin{equation*}
\frac{f_{\mathrm{P}}}{f_{\mathrm{G}}}=1+\frac{\phi_{0} D_{\mathrm{GR}}}{D_{\mathrm{GP}}} \tag{S8}
\end{equation*}
$$

Based on the above equation, when $\phi_{0} D_{\mathrm{GR}}$ cannot be ignored compared with $D_{\mathrm{GP}}$, $f_{\mathrm{P}}$ will be higher than $f_{\mathrm{G}}$, and the $K_{\mathrm{P}}$ ' values will deviate upward from equilibrium state. In other words, when $\phi_{0} F_{\mathrm{GR}}\left(F_{\mathrm{GR}}=f_{\mathrm{G}} D_{\mathrm{GR}}\right.$, the degradation flux of gas phase $)$ cannot be ignored compared with $F_{\mathrm{GP}}\left(F_{\mathrm{GP}}=f_{\mathrm{G}} D_{\mathrm{GP}}\right.$, the flux from gas phase to particle phase), the $K_{P}$ ' values will deviate upward from equilibrium state. Therefore, it can be concluded that the deviation was affected by both the gaseous degradation and the particulate proportion of SVOCs in emission.

continued Table S4

|  | Total Phase |  |  | Particle Phase |  |  | Gas Phase |  |  |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
|  | All season | Heating season | Nonheating season | All season | Heating season | Nonheating season | All season | Heating season | Nonheating season |
| 5\&6\&4-MeChr\&3\&5-MeBaA | 1.90 | 1.46 | 2.42 | 2.01 | 1.46 | 2.77 | 1.31 | 1.17 | 1.46 |
| 3,9-DMeBaA | 1.86 | 1.72 | 2.01 | 1.86 | 1.72 | 2.01 | - | - | - |
| Number of significances | 13 | 6 | 14 | 6 | 3 | 11 | 10 | 7 | 8 |

Note: The bold numbers represent the mean concentrations of Me-PAHs in nighttime were significant different with those in daytime ( $p<0.05$ ).

Table S5. Gaseous degradation rate ( $h^{-1}$ ) (hydroxyl radicals reaction) of Me-Naps and U-PAHs under different temperatures

| PAHs | $k_{\operatorname{deg}_{-} 25}$ | $k_{\text {deg_- }}$ | $k_{\text {deg_5 }}$ |
| :---: | :---: | :---: | :---: |
| 2-MeNap | 0.305 | 0.0787 | 0.417 |
| 1-MeNap | 0.305 | 0.0787 | 0.417 |
| 2,6\&2,7-DMeNap | 0.375 | 0.0966 | 0.512 |
| 1,3-DMeNap | 0.375 | 0.0966 | 0.512 |
| 1,6-DMeNap | 0.375 | 0.0966 | 0.512 |
| 1,4\&1,5-DMeNap | 0.375 | 0.0966 | 0.512 |
| 1,2-DMeNap | 0.375 | 0.0966 | 0.512 |
| acenaphthylene | 0.408 | 0.118 | 0.557 |
| acenaphthene | 0.361 | 0.105 | 0.493 |
| fluorene | 0.0478 | 0.0139 | 0.0653 |

Note: The gaseous degradation rate of PAHs can be calculated using the half-lives of PAHs: $k_{\text {degi }}=$ $\ln (2) / t_{1 / 2}$, and the half-lives of PAHs were calculated from EPI suite.

Fig. S1. Chromatographic separation of $49 \mathrm{Me}-\mathrm{PAHs}$ in standard solutions (100 ng/mL)

Fig. S2. Comparison of the values of N/D ratios for individual Me-PAHs between particle phase and gas phase
(Note: * and ${ }^{* *}$ represent that the differences are significant at 0.05 and 0.01 level.)

Fig. S3. Comparison the regression lines of $\log K_{P^{\prime}}$ against $\log K_{\mathrm{OA}}$ between daytime and nighttime for total Me-PAHs

Fig. S4. Comparison of the regression lines of $\log K_{P}{ }^{\prime}$ against $\log K_{O A}$ between daytime and nighttime for part of individual Me-PAHs

Fig. S5. The fluxes related to the gas and particle phase in the six-compartment model
(Note: $F_{\mathrm{GR}}$ : degradation flux of gas phase $\mathrm{PAHs} ; F_{\mathrm{PR}}$ : degradation flux of particle phase PAHs ; $F_{\mathrm{GP}}$ : migration flux from gas phase to particle phase; $F_{\mathrm{PG}}$ : migration flux from particle phase to gas phase; $F_{\text {GWS_diff: }}$ diffusion fluxes from gas phase to water and/or soil phases; $F_{\mathrm{GW}}$ : wet deposition flux of gas phase PAHs to water and/or soil phase; $F_{\text {WSG_diff: }}$ diffusion fluxes from soil and/or water phases to gas phase; $F_{\mathrm{PD}}$ : dry deposition flux of particle phase PAHs to SPM and/or soil phase; $F_{\mathrm{Pw}}$ : wet deposition flux of particle phase PAHs to SPM and/or soil phase; $\left(1-\phi_{0}\right) E$ : emission flux of gas phase PAHs; $\phi_{0} E$ : emission flux of particle phase PAHs.)
