(a) Entire Region

(b) Arctic

(c) Sub-continental regions

(d) Region including ESAS

Figure S1. Supra-regions (figures a to c) used for applying trends on wetland and anthropogenic CH₄ emissions and RECCAP region including the ESAS (figure d) used for applying trends on oceanic methane sources.

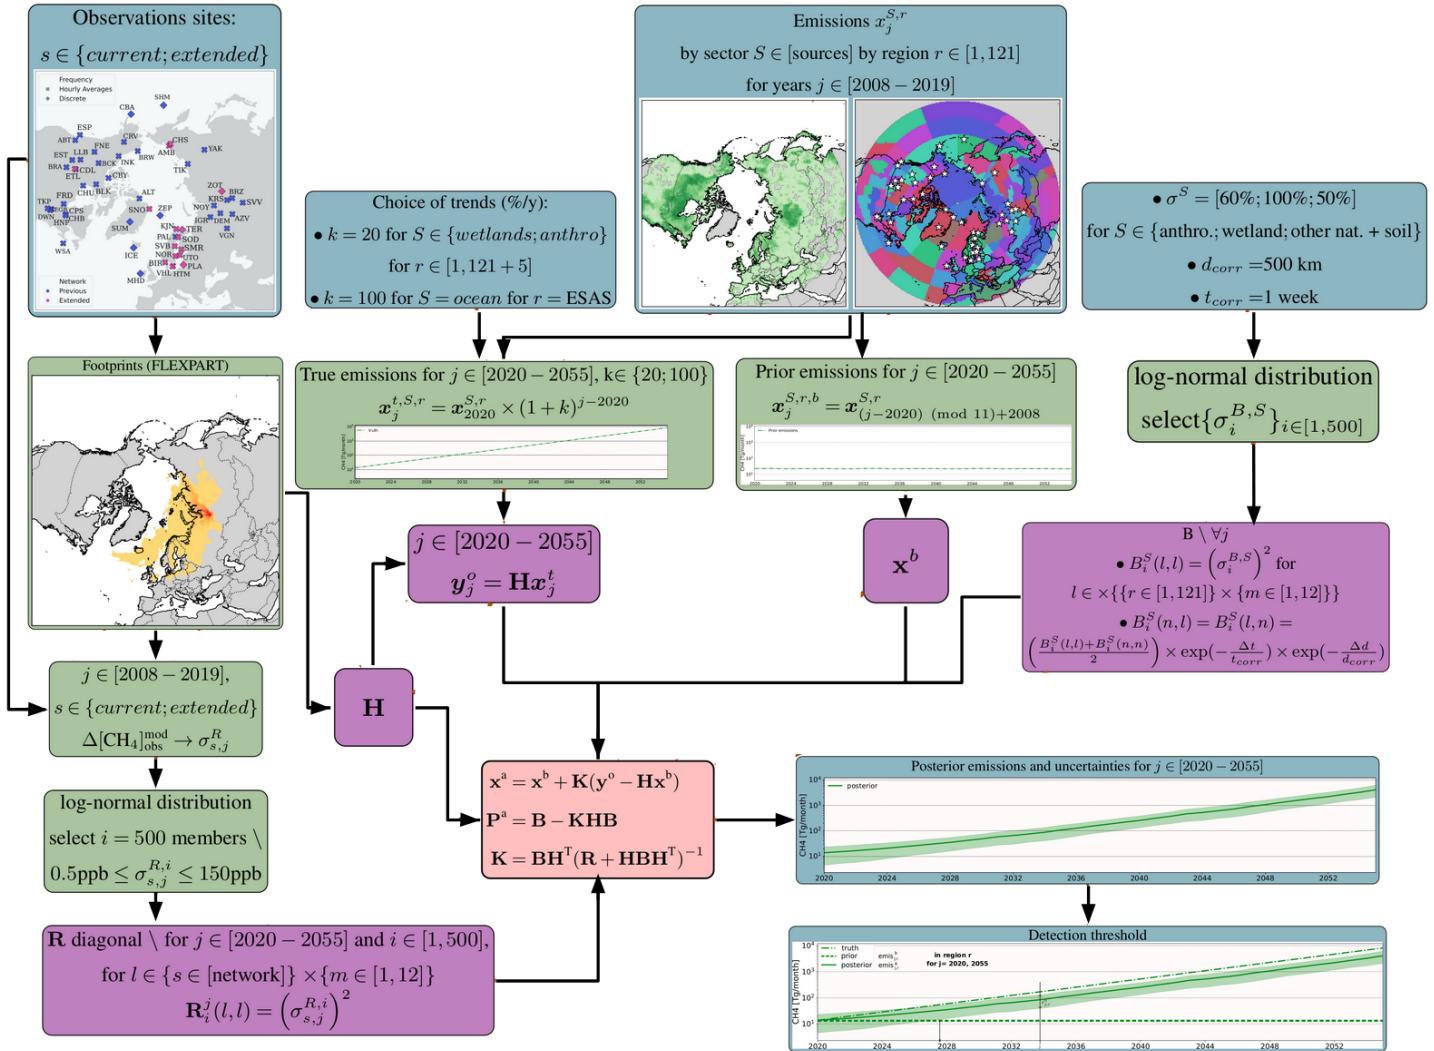

Figure S2. Principle of the inversion set-up used in this study. The observation networks, details on the CH_4 emission scenarios as well as the output data are shown in the blue boxes. The green boxes represent methods on obtaining the input data for the inversion. The red box shows the optimization strategy and the purple boxes the corresponding variables. See Wittig et al. (2023) for full details.
