16 **Section S1. Detail information of test industrial volatile chemical**
17 **product (VCP) sources**

18 The shoemaking industry, as an important economic sector in developing
19 countries, holds significance as one of the industrial VCP sources in the Pearl River
20 Delta (PRD) region (Zheng et al., 2013;Estevan et al., 2012). Reactive organic gases
21 (ROGs) emissions in this industry primarily originate from the extensive use of
22 industrial adhesives, which compositions predominantly consist of butanone, acetone,
23 cyclohexane, and ethyl acetate (Zheng et al., 2013;Zhao et al., 2018;Estevan et al.,
24 2012). The factories involved in this study primarily specialize in producing leather
25 shoes, high-heeled shoes, and other footwear products, with the bottom forming process
26 serving as the primary source of ROG emissions.

27 In the production of various daily necessities including electronic products and
28 auto parts, the process of plastic surface coating plays a crucial role. Raw materials of
29 plastic are nylon, polypropylene, and polycarbonate, and the industrial water-borne
30 coatings was mainly used to spray in this industry. As a representative industry in this
31 study, a plastic toy factory specializing in the production of plastic toys and electronic
32 toys was selected. The main processes contributing to ROG emissions in this factory
33 were manual and automatic spraying (workshop A (manual-spray workshop) and
34 workshop B (auto-spray workshop) in Fig 1b). The concentration of oxygenated ROG
35 species (OVOCs) showed marginal increase after treatment (Fig. S7), only C₈ aromatics
36 exhibited a slight decrease. This could be due to the fact that the adsorption materials
37 used in the ROG treatment devices may not be effective for all ROGs, necessitating
38 timely replacement and underscoring the importance of ROGs removal by treatment
39 devices.

40 The furniture coating industry is recognized as a significant sector for the
41 prevention and control of ROGs in China due to its outdated technology, low pollution
42 control levels, and high ROG emissions (Zheng et al., 2013). Due to the extensive use
43 of industrial coatings (including water-borne and solvent-borne coatings) in the
44 furniture coating industry, ROG emissions mainly come from the primer and topcoat

45 processes (Zhou et al., 2020;Zheng et al., 2013;Fang et al., 2019). As the representative
46 industry in this study, a wood furniture coating factory was selected where topcoat
47 spraying emerged as the primary source of ROG emissions. The discrepancy between
48 ROG concentrations before and after treatment indicates that the ROGs treatment
49 device was ineffective in this factory, possibly due to device malfunction or insufficient
50 replacement of adsorption materials in a timely manner.

51 The printing industry employs various printing techniques, including offset,
52 gravure, letterpress, and digital, to produce a wide range of printed products, such as
53 books, brochures, packaging, and labels (Zheng et al., 2013). ROG emissions from this
54 industry were mainly derived from the industrial inks utilized in the printing production
55 (Zhou et al., 2020;Zheng et al., 2013;Fang et al., 2019). In this study, a comprehensive
56 printing factory encompassing packaging and digital printing was selected as the
57 representative industry, with ROG emissions are generated through the use of industrial
58 inks during the manufacturing process.

59 As one of the important ports and shipbuilding bases in China, the PRD region
60 has a solid foundation in the shipbuilding industry. Utilization of solvent-borne
61 industrial coatings for ship coating remains prevalent due to stringent requirements for
62 anti-rust and anti-corrosion properties. The cost-effectiveness and superior efficiency
63 of solvent-borne industrial coatings outweigh the preference for water-borne industrial
64 coatings alternative (Malherbe and Mandin, 2007). For this study, a large ship coating
65 factory was selected as a representative industry, with ROG emissions primarily
66 occurring during the coating spraying process. Since the coating spraying process is
67 limited to a single workshop, we conducted three repeated experiments at the same
68 sampling point (workshops and after treatment device) to validate our test results (Fig.
69 S6b). It was observed that the concentrations of typical ROGs during the second and
70 third sampling were consistent and stable, indicating the stability of waste gas collection
71 and power generation by the ROGs treatment device. Conversely, the fluctuating
72 concentrations observed during the initial sampling could be attributed to the fresh start
73 of the coating spraying process in the factory or the preheating state of the ROGs

74 treatment device.

75 **Section S2. The fractions of ROGs in total ROG emissions**

76 Combined with the measurements of canisters measured by gas chromatography-
77 mass spectrometer/flame ionization detector (canister-GC-MS/FID) and proton transfer
78 reaction time-of-flight mass spectrometer based on H_3O^+ and NO^+ chemical ionization
79 ($\text{H}_3\text{O}^+/\text{NO}^+$ PTR-ToF-MS), more comprehensive speciation of ROG emissions from
80 industrial VCP sources had been characteristic, and the fractions of ROGs in total ROG
81 emissions can be determined for various industrial VCP sources.

82 In this study, a more comprehensive speciation of ROGs was achieved by the
83 combination of GC-MS/FID and PTR-ToF-MS, the same ROG species from the
84 combination measurement should be counted only once. All ROG species detected in
85 this study is summarized in Table S2. Specifically, to facilitate comparison with
86 traditional photochemical assessment monitoring stations (PAMS) species, C_6 - C_{10}
87 aromatics were identified using GC/MS-FID, while C_{10} - C_{12} alkanes were detected
88 using NO^+ PTR-ToF-MS, as GC-MS/FID only containing the n-alkanes. For unknown
89 ROG species, we used the semi-quantity based on the methods.

90 As shown in Fig. S5, we compared concentrations of toluene and C_8 aromatics
91 from the offline canister-GC-MS/FID and the online $\text{H}_3\text{O}^+/\text{NO}^+$ PTR-ToF-MS,
92 obtaining generally consistent results, considering the large variation in ROG emissions
93 for manufacturing processes conditions and the difficulty to control the fill time for
94 canisters. Due to the results of toluene and C_8 aromatics from H_3O^+ PTR-ToF-MS and
95 the offline canister-GC-MS/FID were consistent in our previous emission source
96 campaign (Wang et al., 2022), the ROGs/toluene ratio and ROGs/ C_8 aromatics ratio
97 were used to evaluate the fractions of ROGs in total ROG emissions. Specifically,
98 ROGs/toluene ratio was used in shoemaking and printing industries, and ROGs/ C_8
99 aromatics ratio was used in plastic surface coating, furniture coating, and ship coating
100 industries, considering the real-time concentrations of toluene and C_8 aromatics in
101 various industries, and the consistency between offline canister GC-MS/FID and

102 H₃O⁺/NO⁺ PTR-ToF-MS (Fig. S5). The fractions were calculated as Equation (1) and
103 (2):

104

$$105 \quad Fraction_{ROGs,i} = \frac{\frac{C_{ROGs,i}}{C_{toluene,PTR}}}{\left(\frac{C_{ROGs,i}}{C_{toluene,PTR}} + \frac{C_{other\ ROGs,i}}{C_{toluene,GC}}\right)} * 100\% \quad (1)$$

106

$$107 \quad Fraction_{ROGs,i} = \frac{\frac{C_{ROGs,i}}{C_{C8\ Aromatics,PTR}}}{\left(\frac{C_{ROGs,i}}{C_{C8\ Aromatics,PTR}} + \frac{C_{other\ ROGs,i}}{C_{C8\ Aromatics,GC}}\right)} * 100\% \quad (2)$$

108

109 Where $Fraction_{ROGs,i}$ is the fraction of ROGs, i; $C_{ROGs,i}$, $C_{toluene,PTR}$, and
110 $C_{C8\ Aromatics,PTR}$ are the concentrations of ROGs, i, toluene, and C₈ aromatics measured
111 by H₃O⁺ PTR-ToF-MS. $C_{other\ ROGs,i}$, $C_{toluene,GC}$, and $C_{C8\ Aromatics,GC}$ are the
112 concentrations of other ROGs, i, toluene, and C₈ aromatics measured by offline
113 canister-GC-MS/FID, and the concentration of C₈ aromatics was the total concentration
114 of ethylbenzene, o-xylene, and m/p-xylene.

115

116 **Supplement tables**

117 **Table S1.** Detailed information of the test industrial VCP sources in this study.

118

Industrial VCP sources	Sampling location	samples
Shoemaking	Semi-open workshops	3
	Before treatment	1
	After treatment (stack)	1
Plastic surface coating	Semi-open workshops	5
	Before treatment	3
	After treatment (stack)	2

120

121 **Table S2. Detailed information of ROG species measured by different instruments.**

122

Components	Measurements	ROG species
OVOCs	PTR-H ₃ O ⁺	formula only including CHO
N/S-containing	PTR-H ₃ O ⁺	formula including CHN, CHS, CHON, CHOS, and CHONS
Heavy aromatics and monoterpenes	PTR-H ₃ O ⁺	monoterpenes, C ₁₁ -C ₂₀ aromatics and polynuclear aromatic hydrocarbons (PAHs)
Higher alkanes	PTR-NO ⁺	C ₁₀ -C ₂₀ acyclic, cyclic and bicyclic alkanes
Alkanes	GC-MS/FID	C ₂ -C ₉ alkanes
Alkenes	GC-MS/FID	C ₂ -C ₆ alkenes
Aromatics	GC-MS/FID	C ₆ -C ₁₀ aromatics
Halohydrocarbons	GC-MS/FID	C ₁ -C ₆ halohydrocarbons

123

124

125 **Table S3.** Sensitivities of H₃O⁺ PTR-ToF-MS for various ROGs calibrated with
 126 standard gas.
 127

ROGs	Ion formula (H ⁺)	Sensitivity, cps·ppb ⁻¹
Species calibrated with standard gas		
HCN	HCNH ⁺	630.86
Formaldehyde	CH ₂ OH ⁺	1063.76
Methanol	CH ₄ OH ⁺	757.38
Acetonitrile	C ₂ H ₃ NH ⁺	3006.75
Acetaldehyde	C ₂ H ₄ OH ⁺	3782.23
Ethanol	C ₂ H ₆ OH ⁺	131.58
Acrolein	C ₃ H ₄ OH ⁺	4097.50
Acetone	C ₃ H ₆ OH ⁺	4943.88
Isopropanol	C ₃ H ₈ OH ⁺	-
Furan	C ₄ H ₄ OH ⁺	2993.73
Isoprene	C ₅ H ₈ H ⁺	1589.89
MVK	C ₄ H ₆ OH ⁺	3396.10
MEK	C ₄ H ₈ OH ⁺	4089.86
Hydroxy acetone	C ₃ H ₆ O ₂ H ⁺	3172.43
Benzene	C ₆ H ₆ H ⁺	3629.18
2-Pentanone	C ₅ H ₁₀ OH ⁺	4120.96
Ethyl acetate	C ₄ H ₈ O ₂ H ⁺	959.96
Toluene	C ₇ H ₈ H ⁺	4584.74
Phenol	C ₆ H ₆ OH ⁺	5064.30
Furfural	C ₅ H ₄ O ₂ H ⁺	10109.39
Methyl Isobutyl Ketone	C ₆ H ₁₂ OH ⁺	3446.37
Styrene	C ₈ H ₈ H ⁺	5858.41
o-Xylene	C ₈ H ₁₀ H ⁺	4883.79
m-Cresol	C ₇ H ₈ OH ⁺	5191.14
1,2,4-Teimethylbenzene	C ₉ H ₁₂ H ⁺	5337.79
Guaiacol	C ₇ H ₈ O ₂ H ⁺	7090.09
Naphthalene	C ₁₀ H ₈ H ⁺	7485.81
a-Pinene	C ₁₀ H ₁₆ H ⁺	1626.14
Chlorobenzene	C ₆ H ₅ ClH ⁺	5084.49
1,3-Dichlorobenzene	C ₆ H ₄ Cl ₂ H ⁺	6314.09
1,3,5-Trichlorobenzene	C ₆ H ₃ Cl ₃ H ⁺	8130.16
D3 Siloxane	C ₆ H ₁₈ O ₃ Si ₃ H ⁺	3620.62
D4 Siloxane	C ₈ H ₂₄ O ₄ Si ₄ H ⁺	3236.92
D5 Siloxane	C ₁₀ H ₃₀ O ₅ Si ₅ H ⁺	2991.05

128

129 **Table S4.** Sensitivities of NO⁺ PTR-ToF-MS for alkanes and cycloalkanes calibrated
 130 with standard gas.

131

ROGs	Formula	Sensitivity, ncps·ppb ⁻¹
Species calibrated with standard gas		
C ₈ Alkanes	C ₈ H ₁₈	99.79
C ₉ Alkanes	C ₉ H ₂₀	79.91
C ₁₀ Alkanes	C ₁₀ H ₂₂	68.27
C ₁₁ Alkanes	C ₁₁ H ₂₄	68.13
C ₁₂ Alkanes	C ₁₂ H ₂₆	77.43
C ₁₃ Alkanes	C ₁₃ H ₂₈	104.81
C ₁₄ Alkanes	C ₁₄ H ₃₀	140.81
C ₁₅ Alkanes	C ₁₅ H ₃₂	164.34
C ₁₀ cyclic alkanes	C ₁₀ H ₂₀	137.54
C ₁₁ cyclic alkanes	C ₁₁ H ₂₂	119.71
C ₁₂ cyclic alkanes	C ₁₂ H ₂₄	131.94
C ₁₃ cyclic alkanes	C ₁₃ H ₂₆	147.60
C ₁₄ cyclic alkanes	C ₁₄ H ₂₈	150.12
C ₁₅ cyclic alkanes	C ₁₅ H ₃₀	137.38 ^a

132 ^a: The average sensitivity of C₁₀–C₁₄ cyclic alkanes was used to predict the concentrations of cyclic
 133 alkanes with higher carbon (C₁₅–C₂₀) and bicyclic alkanes (C₁₀–C₂₀) (Chen et al., 2022).

134

135

136 **Table S5.** Sensitivities of H₃O⁺ PTR-ToF-MS for various ROGs calibrated with liquid
137 calibration unit (LCU).

138

ROGs	Ion formula	Sensitivity, cps·ppb⁻¹
Species calibrated with liquid calibration unit (LCU)		
Formic acid	CH ₂ O ₂ H ⁺	939.43
Acetic acid	C ₂ H ₄ O ₂ H ⁺	1876.45
Propionic acid	C ₃ H ₆ O ₂ H ⁺	2272.36
Butyric acid	C ₄ H ₈ O ₂ H ⁺	3531.01
Pyrrole	C ₄ H ₅ NH ⁺	3219.67
Formamide	CH ₃ NOH ⁺	3567.04
Acetamide	C ₂ H ₅ NOH ⁺	4959.81
Catechol	C ₆ H ₆ O ₂ H ⁺	2035.52
Guaiacol	C ₇ H ₈ O ₂ H ⁺	5989.24

^a: Si/Cl-containing are including D₃-D₆ siloxanes and chlorobenzenes.

^b: Heavy aromatics and monoterpenes are including monoterpenes, C₁₁-C₂₀ aromatics and PAHs such as naphthalene, methylnaphthalene etc.

^c: Higher alkanes are including C₁₀-C₂₀ acyclic, cyclic and bicyclic alkanes.

Table S12. Fractions of the top ten most abundant species in total ROG emissions, total OHR, and total ozone formation potential (OFP) from (a) shoemaking, (b) plastic surface coating, (c) furniture coating, (d) printing, and (e) ship coating industries.

(a) Shoemaking									
num	Concentration			OH reactivity			OFP		
	species name	formula	fraction (%)	species name	formula	fraction (%)	species name	formula	fraction (%)
1	Isopentane	C5H12	24.39	isoPropanol	C3H8O	27.32	Isopentane	C5H12	24.53
2	MEK	C4H8O	21.36	MEK	C4H8O	24.73	MEK	C4H8O	21.94

	Total fraction		92.70			92.66			96.38

Table S13. The θ angles ($^{\circ}$) among the mass spectra of workshops, before and after treatment in industrial VCP sources.

Industrial VCP sources	Sites	Workshops	Before treatment	After treatment
Shoemaking	Workshops	0.0	40.9	49.2
	Before treatment	40.9	0.0	27.0
	After treatment	49.2	27.0	0.0
Plastic surface coating	Workshops	0.0	26.0	15.6
	Before treatment	26.0	0.0	13.6
	After treatment	15.6	13.6	0.0
Furniture coating	Workshops	0.0	8.3	12.5
	Before treatment	8.3	0.0	7.5
	After treatment	12.5	7.5	0.0
Printing	Workshops	0.0	4.2	6.2
	Before treatment	4.2	0.0	2.5
	After treatment	6.2	2.5	0.0
Ship coating	Workshops	0.0		7.6
	After treatment	7.6		0.0

Supplement figures

Figure S1. A (a) mobile monitoring vehicle was parking equipped with (b) online measurement instruments at a fixed site which close to (c) the sampling ports of semi-open workshops and (d) stack emissions.

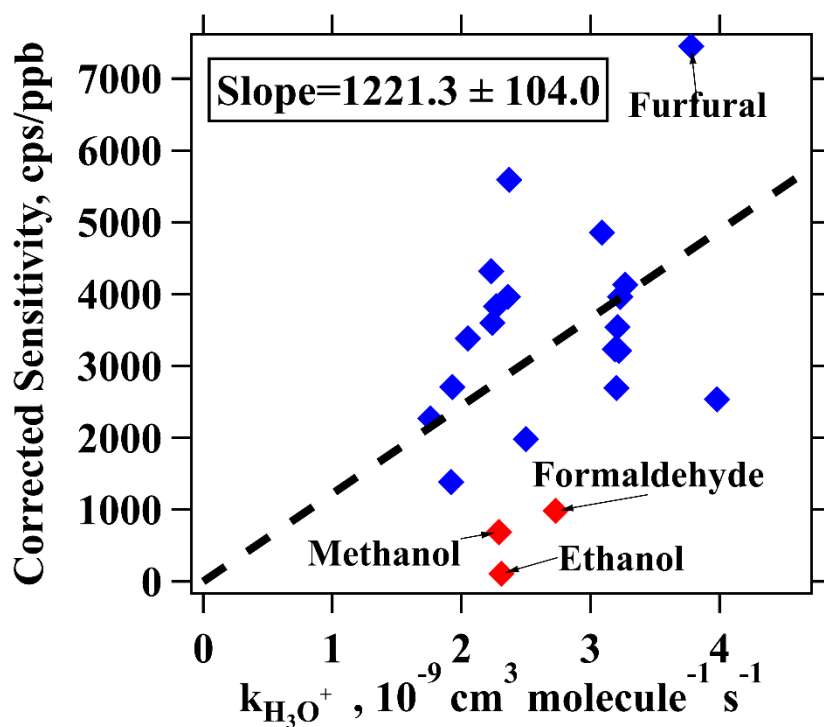

Figure S2. Corrected sensitivities as a function of kinetic rate constants for proton transfer reactions of H_3O^+ with ROGs. The dashed line indicates the fitted line for blue points. The red points not used as these compounds (formaldehyde, methanol, and ethanol) are known to have lower sensitivities.

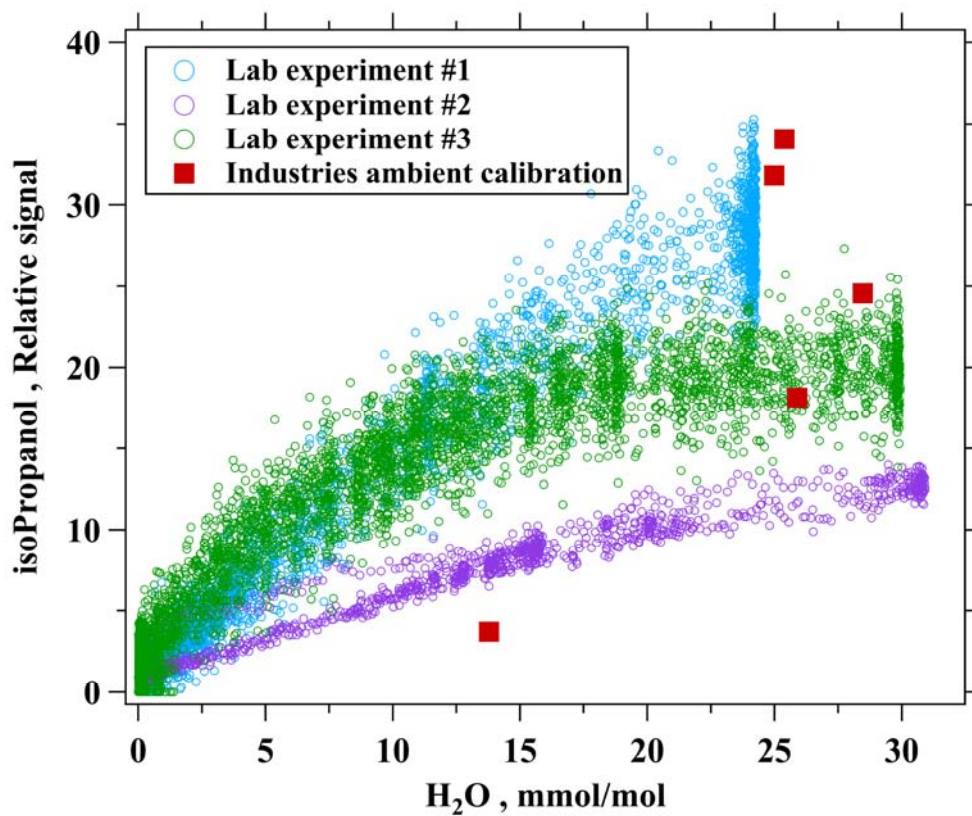

Figure S3. Humidity dependence of relative signal (wet versus dry) of isopropanol, including results in lab experiments (blue, green, and purple markers) and calibration the under ambient humidity conditions during the field campaign in this study (red markers).

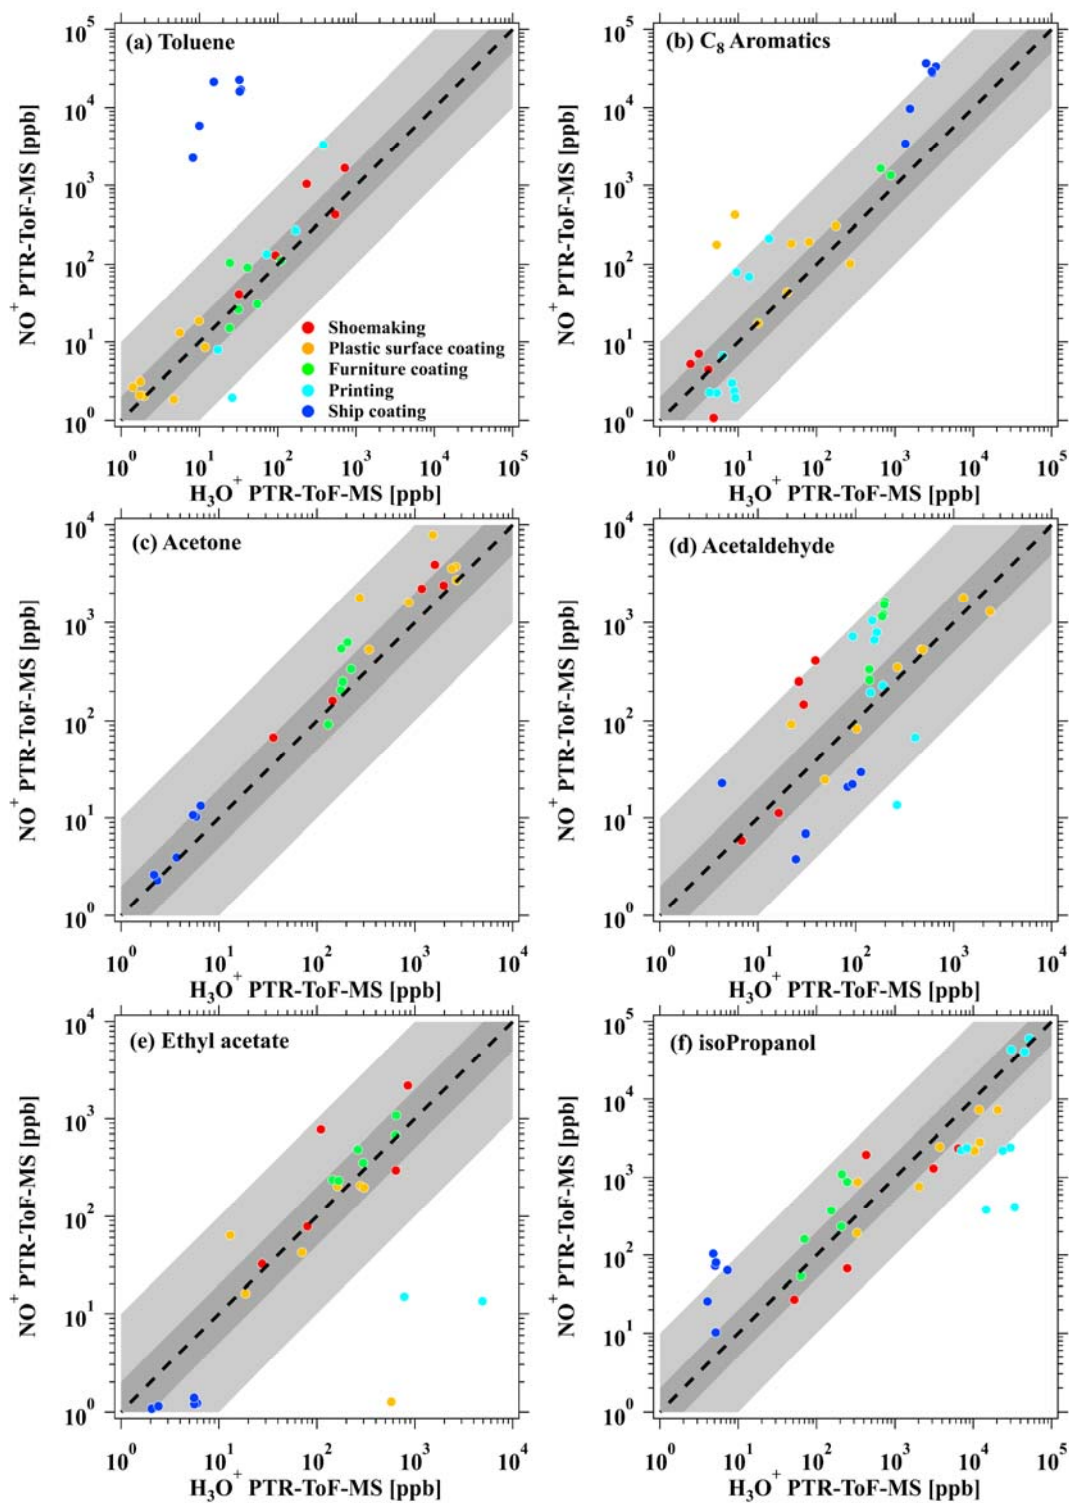

Figure S4. Scatterplot of (a) toluene, (b) C_8 aromatics, (c) acetone, (d) acetaldehyde, (e) ethyl acetate, and (f) isopropanol concentrations measured by H_3O^+ PTR-ToF-MS and NO^+ PTR-ToF-MS. The black dashed lines represent 1:1 ratio, and the shaded areas represent ratios of a factor of 2 and 10.

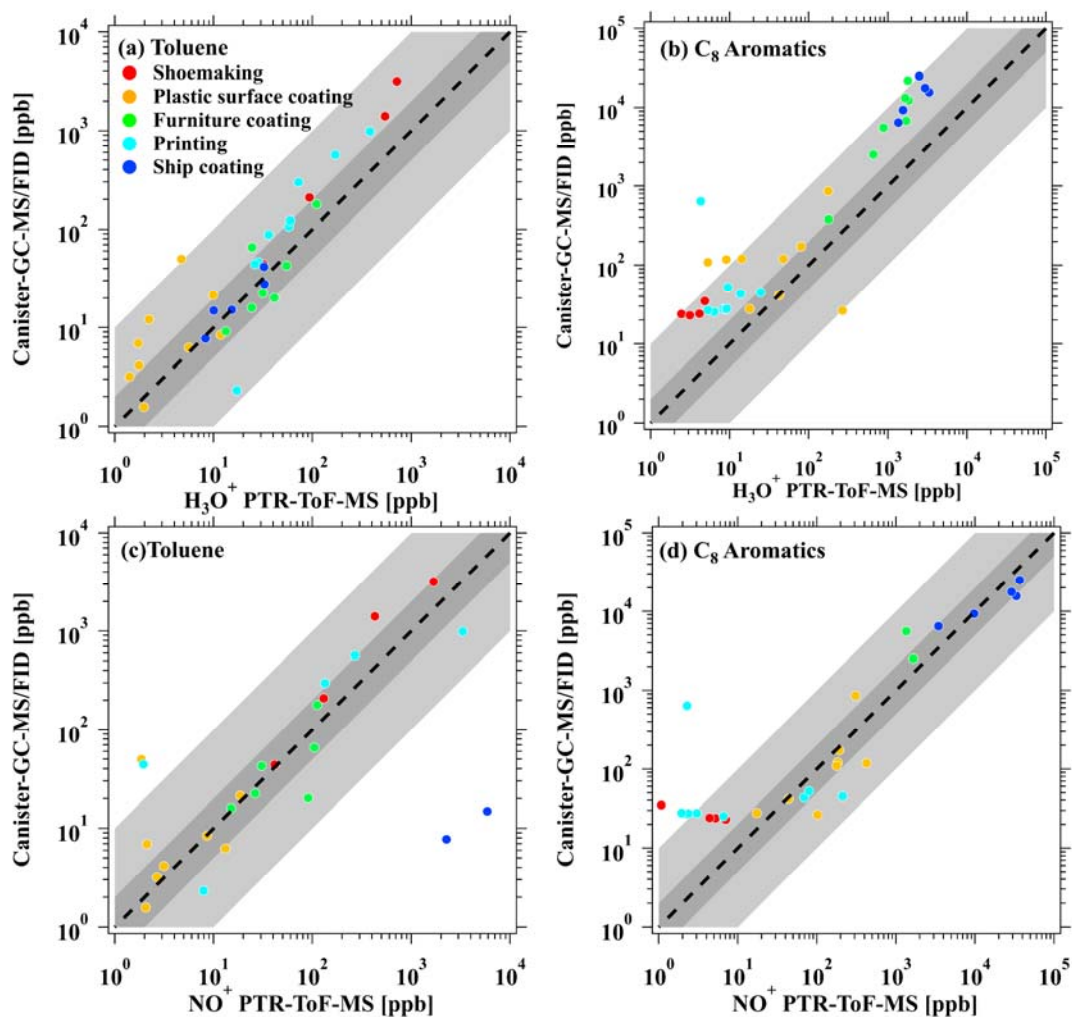

Figure S5. Scatterplot of (a) toluene and (b) C₈ aromatic concentrations measured by H_3O^+ PTR-ToF-MS and canister-GC-MS/FID. And (c) toluene and (d) C₈ aromatics concentrations measured by NO^+ PTR-ToF-MS and canister-GC-MS/FID. The black dashed lines represent 1:1 ratio, and the shaded areas represent ratios of a factor of 2 and 10.

Figure S6. Real-time concentrations of representative ROGs from workshops, before and after the ROG treatment devices in (a) printing and (b) ship coating industries.

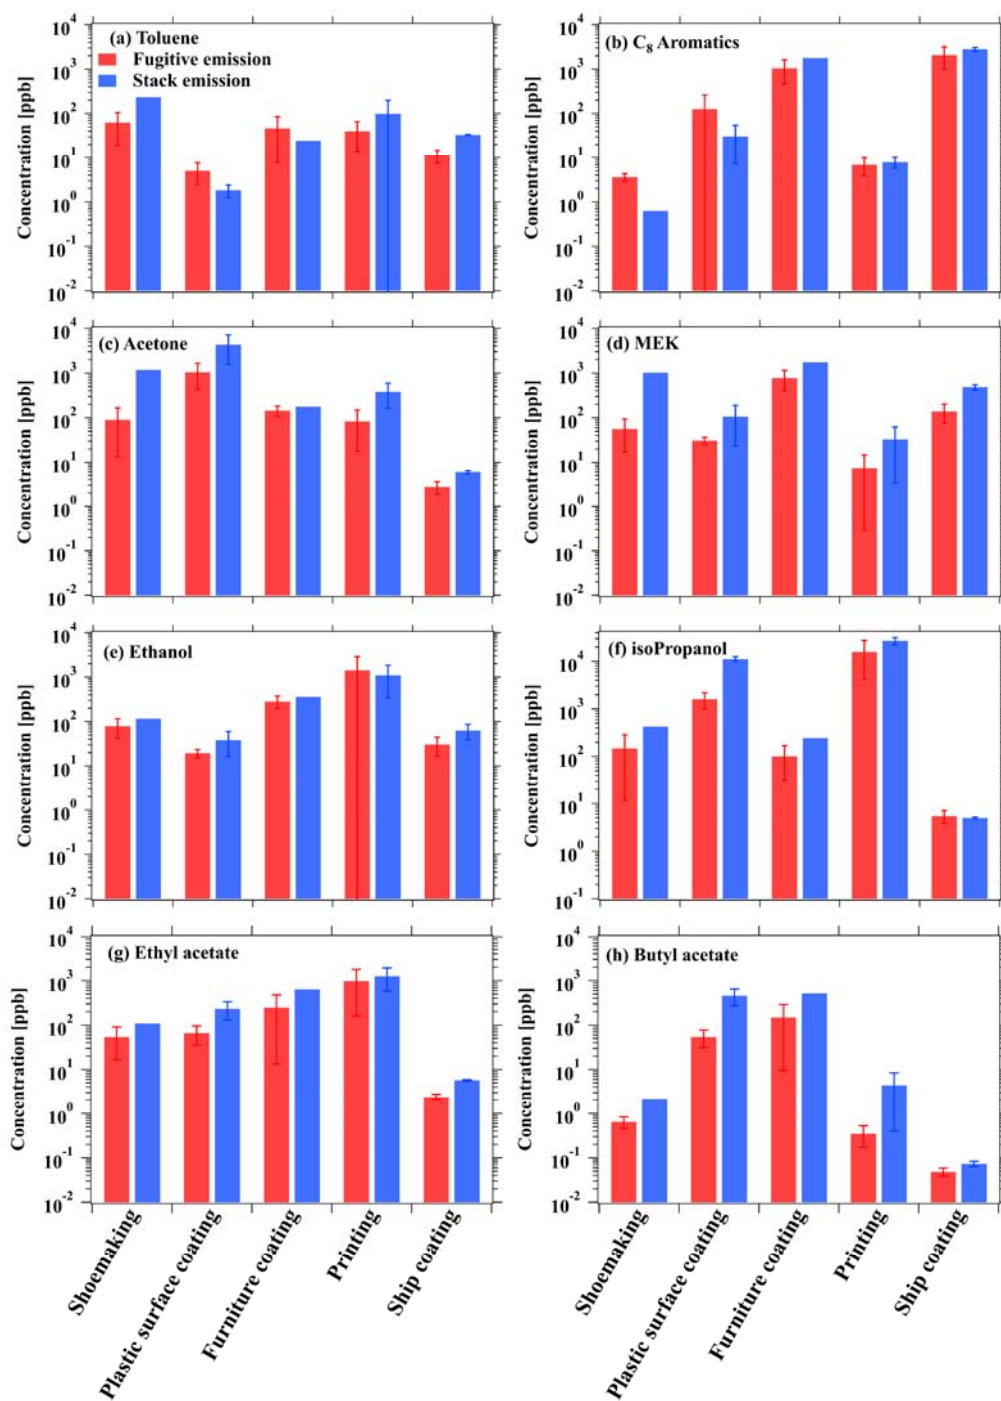

Figure S7. Average concentrations of (a) toluene, (b) C₈ aromatics, (c) acetone, (d) MEK, (e) ethanol, (f) isopropanol, (g) ethyl acetate, and (h) butyl acetate from both workshops (workshops emission) and after ROG treatment devices (stack emission) in shoemaking, plastic surface coating, furniture coating, printing, and ship coating industries, respectively. Error bars represent the standard deviations of the concentration.

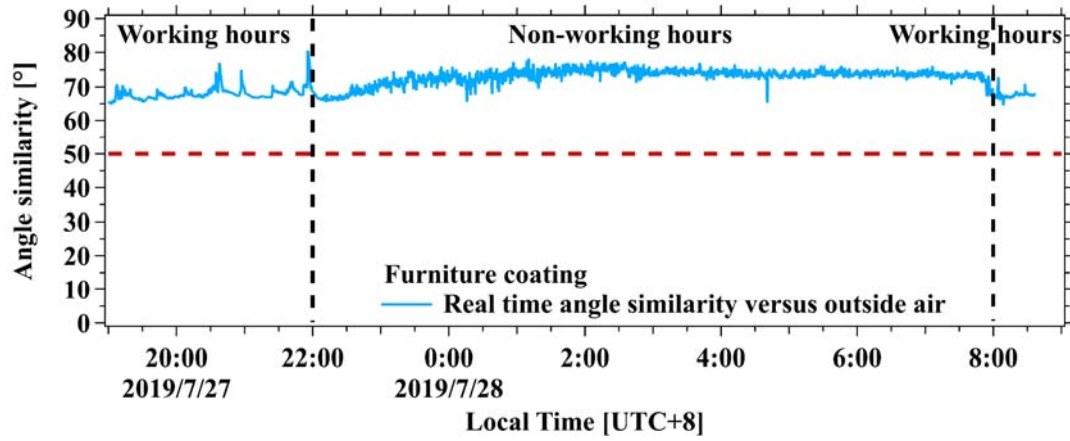

Figure S8. The θ angles of mass spectra among real-time concentrations versus outside air measurement in the furniture coating industry.

Figure S9. The fractions of different ROG categories measured by the PTR-ToF-MS from stack emissions across various industrial VCP sources.

Figure S10. Accumulated fractions of the top 100 species in total ROG emissions, OHR, and OFP from (a) shoemaking, (b) plastic surface coating, (c) furniture coating, (d) printing, and (e) ship coating industries. The gray dashed lines represent accumulated fractions of the top ten in total ROG emissions, OHR and OFP.

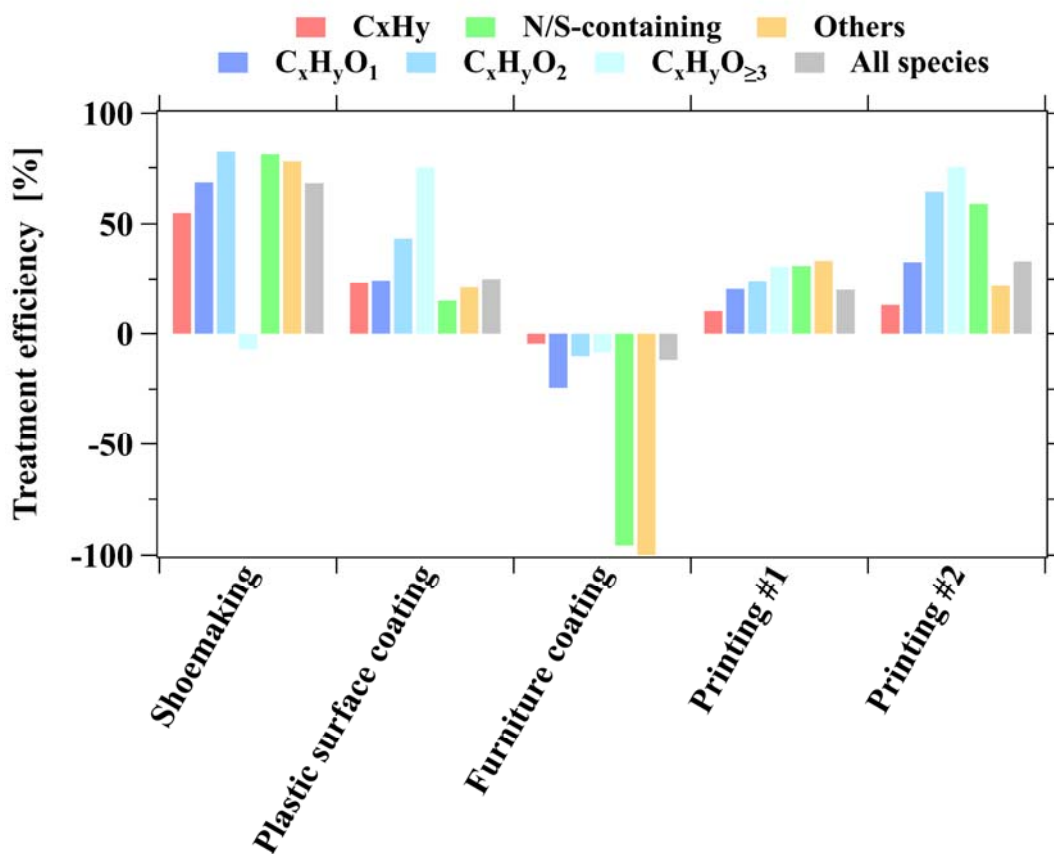

Figure S11. Treatment efficiencies of different ROG categories provided by treatment devices in various industrial VCP sources.

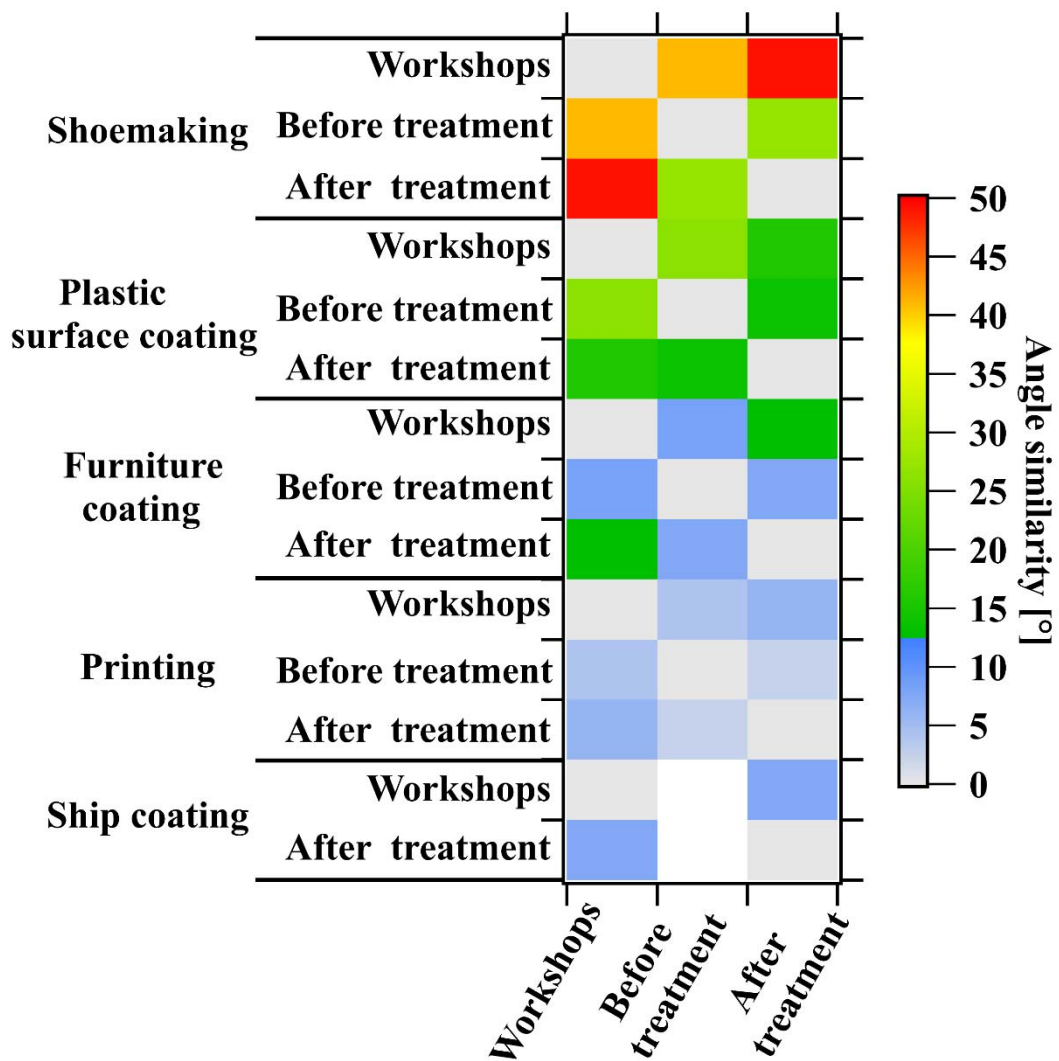

Figure S12. The θ angles among the mass spectra of workshops, before and after treatment in industrial VCP sources.

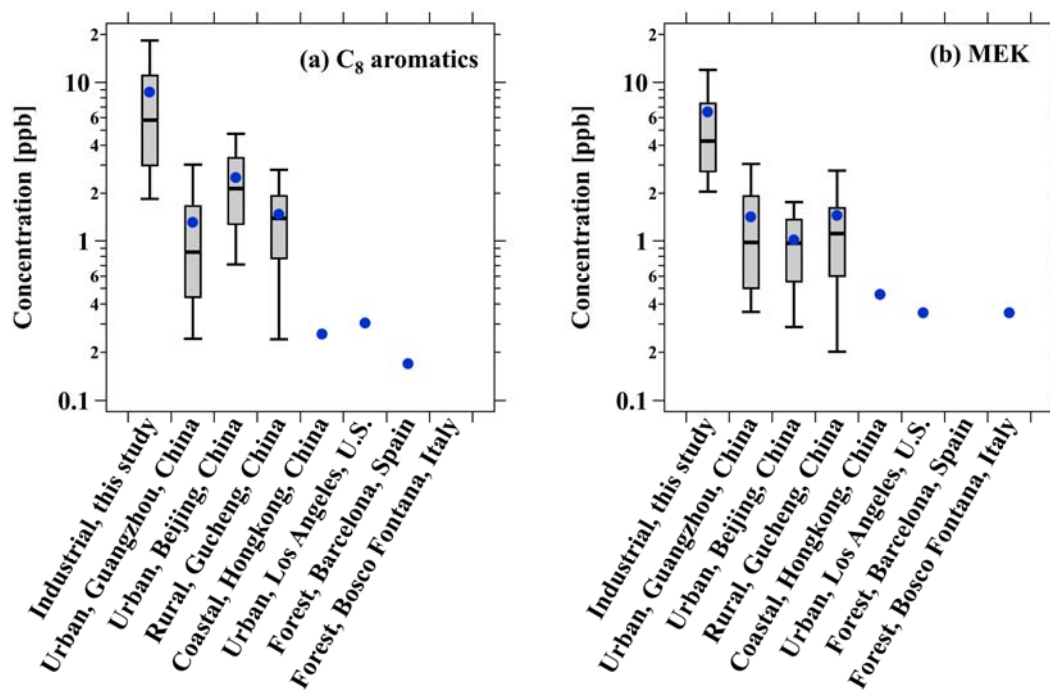

Figure S13. Boxplots of (a) C₈ aromatics and (b) MEK concentrations across the industrial site in this study and clean environments from previous studies.
