

Supplement of

A diagnostic intercomparison of modeled ozone dry deposition over North America and Europe using AQMEII4 regional-scale simulations

Christian Hogrefe et al.

| | Figure S6: Percentage contributions of grid-scale ozone effective conductances to the sum of all pathways, averaged over the entire year. Results are for the EUR domain during 2010. Note that these maps are not clipped to the domain common to all simulations and show the maximum spatial extent of non-water cells submitted for each model..... | 14 |
| 65 | Figure S7. Percentage contributions of grid-scale ozone effective conductances to the sum of all pathways, averaged over all hours during summer. Results are for the NA domain during 2016. Note that these maps are not clipped to the domain common to all simulations and show the maximum spatial extent of non-water cells submitted for each model. | 15 |
| | Figure S8: As in Figure S5 but for winter. | 16 |
| 70 | Figure S9: Summer and winter effective conductances and ozone deposition velocities calculated by the grid models for evergreen needleleaf forest grid cells and calculated by the corresponding subset of single point (SP) models analyzed in Clifton et al. (2023) at the Hyytiälä (HY) site. In the x-axis labels, results for the SP GEM-MACH Wesely simulations are shown as “SP GM Wesely” while results for the SP WRF-Chem Wesely simulations are shown as “SP WC Wesely”. The evergreen needleleaf forest grid cells selected for this analysis are those in which a given model had at least 85% coverage for this LU category. The number of these grid cells differs across models due to underlying | 17 |
| 75 | differences in LU (see Section 3.3). | |
| | Figure S10: Summer and winter effective conductances and ozone deposition velocities calculated by the grid models for deciduous broadleaf forest grid cells and calculated by the corresponding subset of single point (SP) models analyzed in Clifton et al. (2023) at the Ispra (IS) site. In the x-axis labels, results for the SP GEM-MACH Wesely simulations are shown as “SP GM Wesely” while results for the SP WRF-Chem Wesely simulations are shown as | 18 |
| 80 | “SP WC Wesely”. The deciduous broadleaf forest grid cells selected for this analysis are those in which a given model had at least 85% coverage for this LU category. The number of these grid cells differs across models due to underlying differences in LU (see Section 3.3). | |
| | Figure S11: Summer and winter effective conductances and ozone deposition velocities calculated by the grid models for grassland grid cells and calculated by the corresponding subset of single point (SP) models analyzed in Clifton et | 19 |
| 85 | al. (2023) at the Easter Bush (EB) and Bugacpuszta (BP) sites. In the x-axis labels, results for the SP GEM-MACH Wesely simulations are shown as “SP GM Wesely” while results for the SP WRF-Chem Wesely simulations are shown as “SP WC Wesely”. The grassland grid cells selected for this analysis are those in which a given model had at least 85% coverage for this LU category. The number of these grid cells differs across models due to underlying differences in LU (see Section 3.3). | |
| 90 | Figure S12: Fractional coverage of the evergreen needleleaf forest LU category for each of the participating models over the NA domain. | 20 |
| | Figure S13: Fractional coverage of the evergreen needleleaf forest LU category for each of the participating models over the EUR domain. | 21 |
| 95 | Figure S14: For each LU category, maps depicting the location of grid cells that i) do not share a common dominant LU category across models (white cells), ii) share a common dominant LU category across models but not all models | |

| | | |
|-----|---|----|
| | have a fractional coverage > 85% for that LU category (blue cells), or iii) share a common dominant LU category across models and all models have a fractional coverage > 85% for that LU category (red). Results show are for the NA domain. The number of blue and red cells is shown as insert in each map. No maps are shown for the deciduous needleleaf forest, herbaceous, and savanna LU categories because there is not a single common dominant LU grid cell across models for these categories (see Table 5). | 22 |
| 100 | Figure S15. For each LU category, maps depicting the location of grid cells that i) do not share a common dominant LU category across models (white cells), ii) share a common dominant LU category across models but not all models have a fractional coverage > 85% for that LU category (blue cells), or iii) share a common dominant LU category across models and all models have a fractional coverage > 85% for that LU category (red). Results show are for the EUR domain. The number of blue and red cells is shown as insert in each map. No maps are shown for the deciduous needleleaf forest, evergreen broadleaf forest, mixed forest, shrubland, herbaceous, savanna, wetlands, tundra, and snow and ice LU categories because there is not a single common dominant LU grid cell across models for these categories (see Table 5). | 23 |
| 105 | Figure S16. LU-specific annual domain-total dry deposition fluxes (Tg), LU-specific annual mean dry deposition velocity (cm/s), and percentage LU category domain coverage (excluding water grid cells) for seven selected LU categories over the EUR domain. For each LU category and model, the analysis considered grid cells in the analysis domain common to all models in which a given model had at least 85% coverage for this LU category. The number of these grid cells differs across models due to underlying differences in LU (see Section 3.3)..... | 24 |

| 22: Mixed Tundra | 19: Mixed Tundra |
| 23: Bare Ground Tundra | N/A |
| 24: Snow or Ice | 15: Snow and Ice |

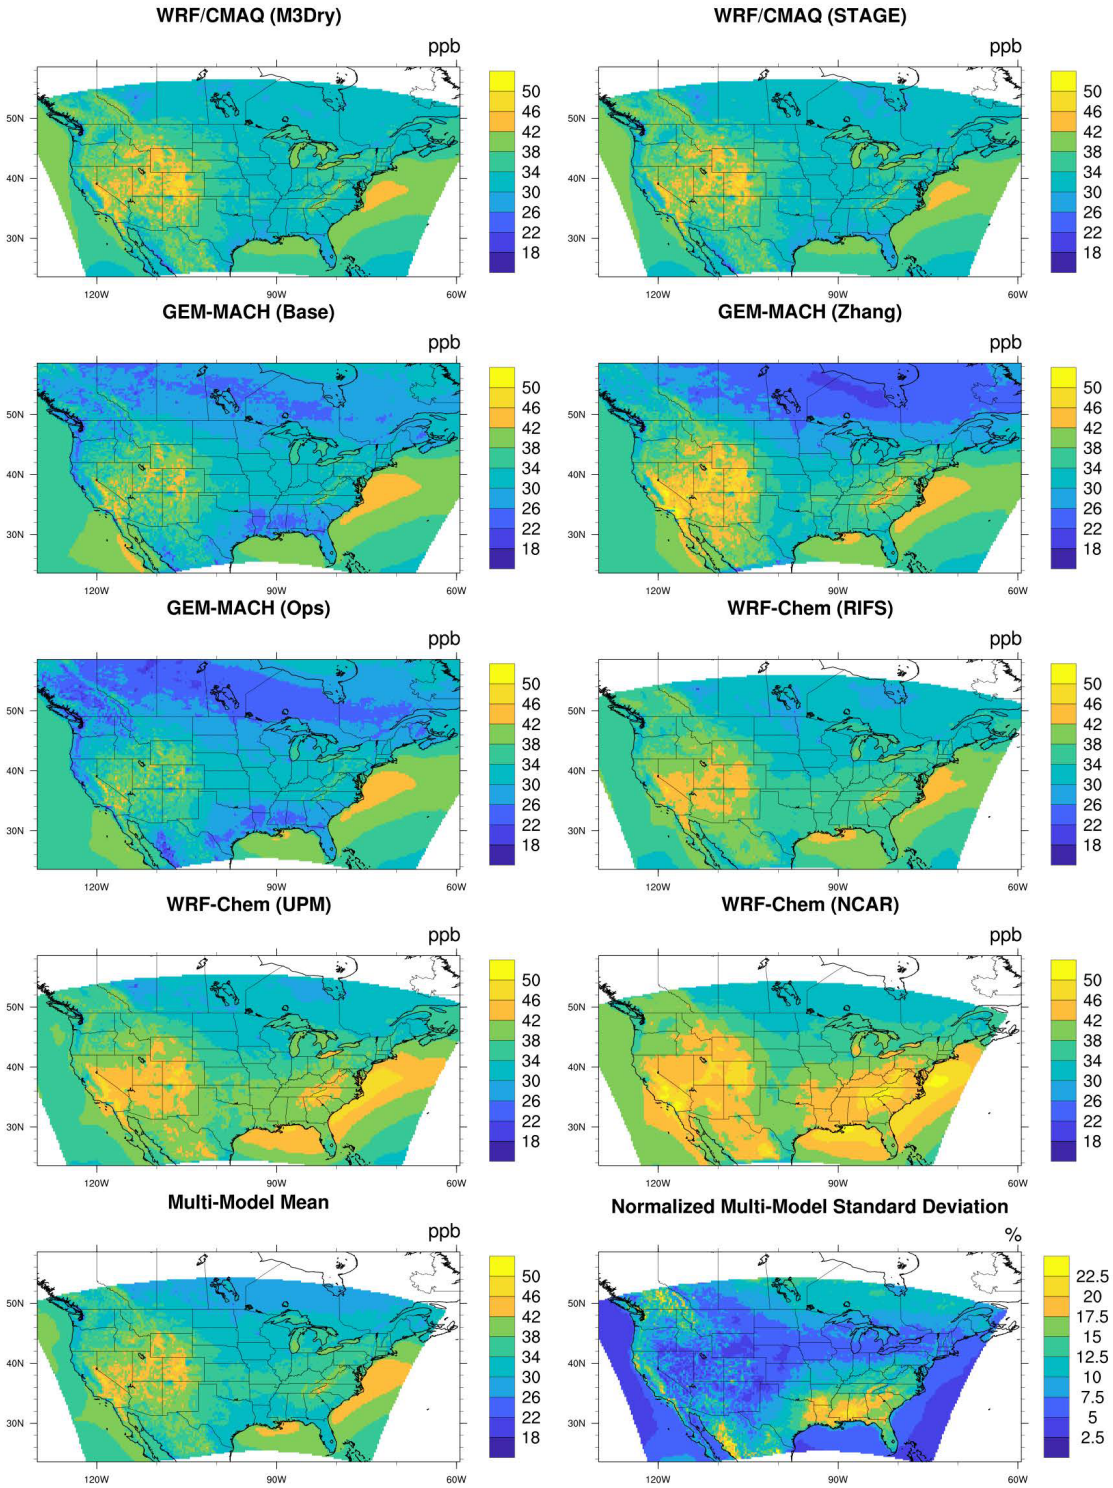

Figure S1: 2016 annual total O_3 mixing ratio (ppb) for each model, the multi-model mean, and the normalized multi-model standard deviation over the NA domain. Note that the plots for individual models are not clipped to the domain common to all simulations and show the maximum spatial extent submitted for each model. The multi-model mean and normalized standard deviations are calculated and shown over the common domain.

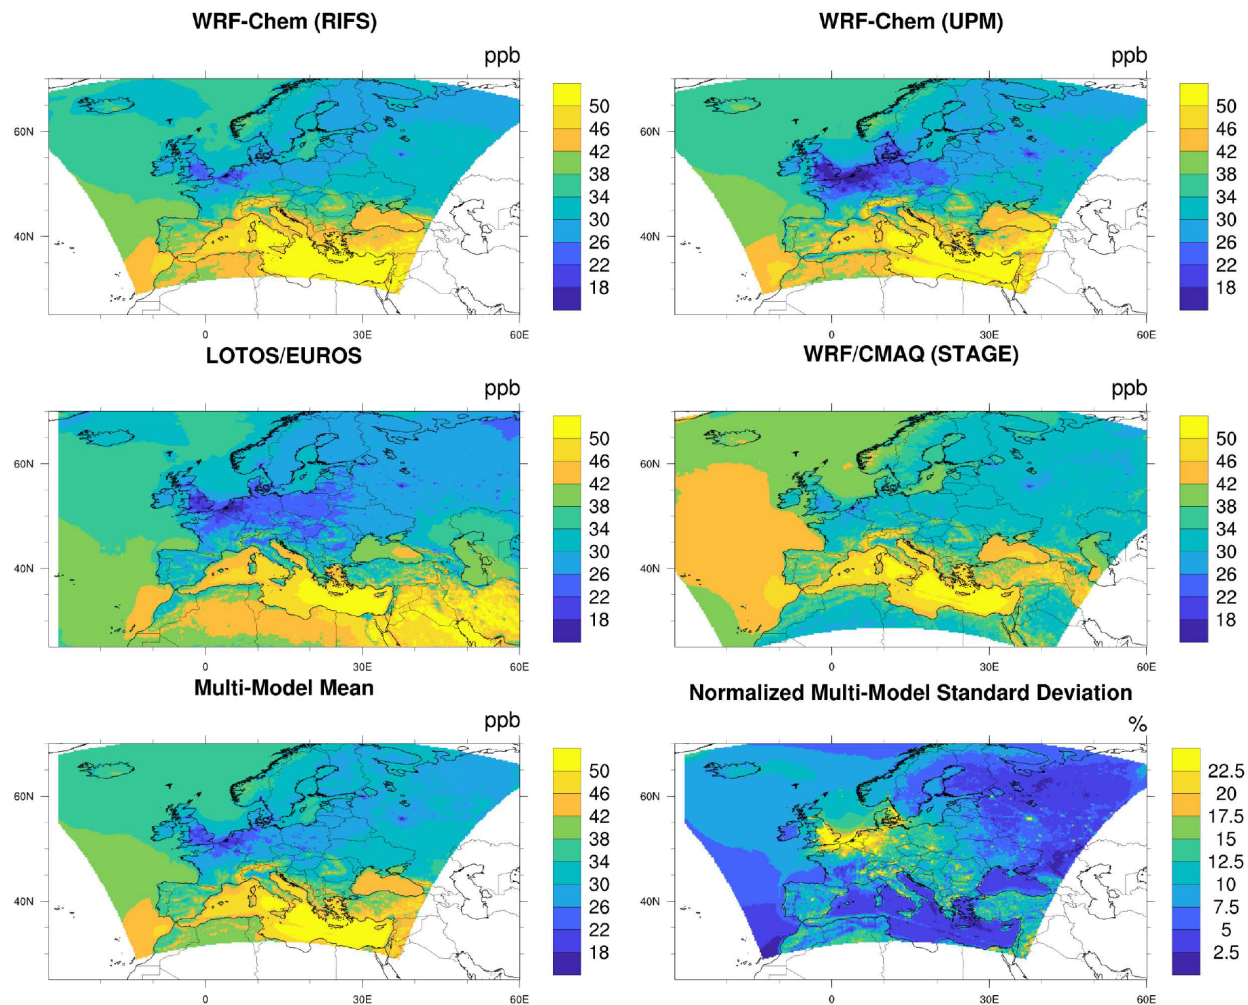

Figure S2: 2016 annual total O₃ mixing ratio (ppb) for each model, the multi-model mean, and the normalized multi-model standard deviation over the EUR domain. Note that the plots for individual models are not clipped to the domain common to all simulations and show the maximum spatial extent submitted for each model. The multi-model mean and normalized standard deviations are calculated and shown over the common domain.

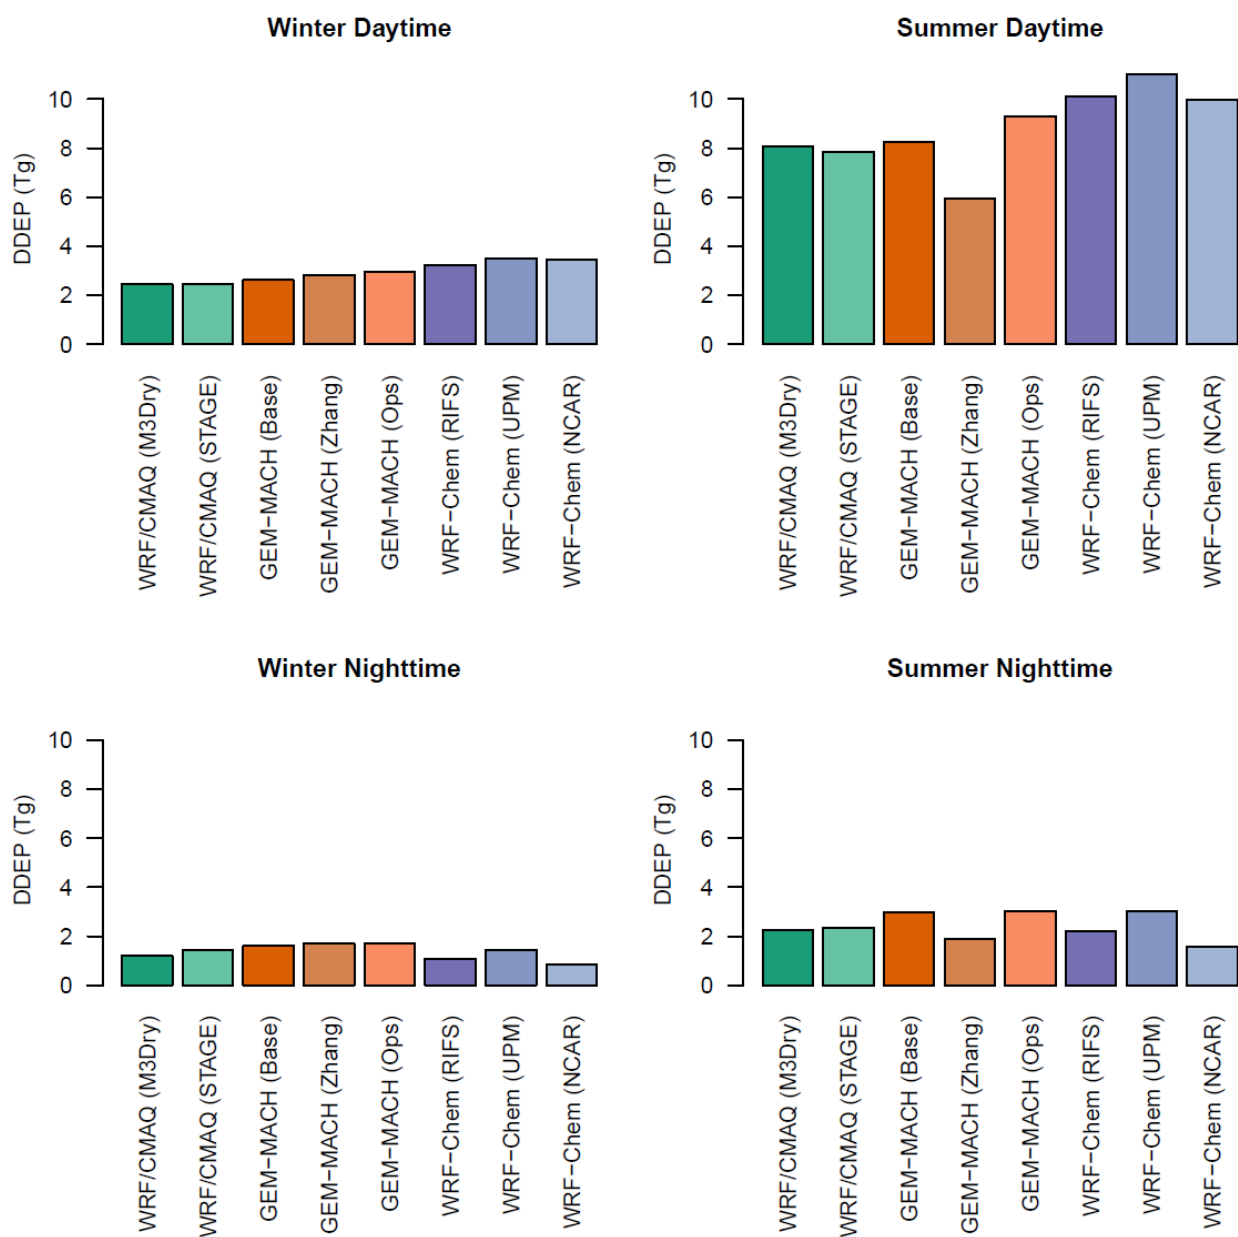

Figure S3: Seasonal and diurnal variations in 2016 NA domain total O₃ grid-scale dry deposition fluxes (in Tg). Totals are calculated over all non-water grid cells in the analysis domain common to all models. Daytime values are calculated from 10:00 LST to 14:00 LST while nighttime values are calculated from 22:00 LST to 02:00 LST. a) winter daytime, b) summer daytime, c) winter nighttime, d) summer nighttime

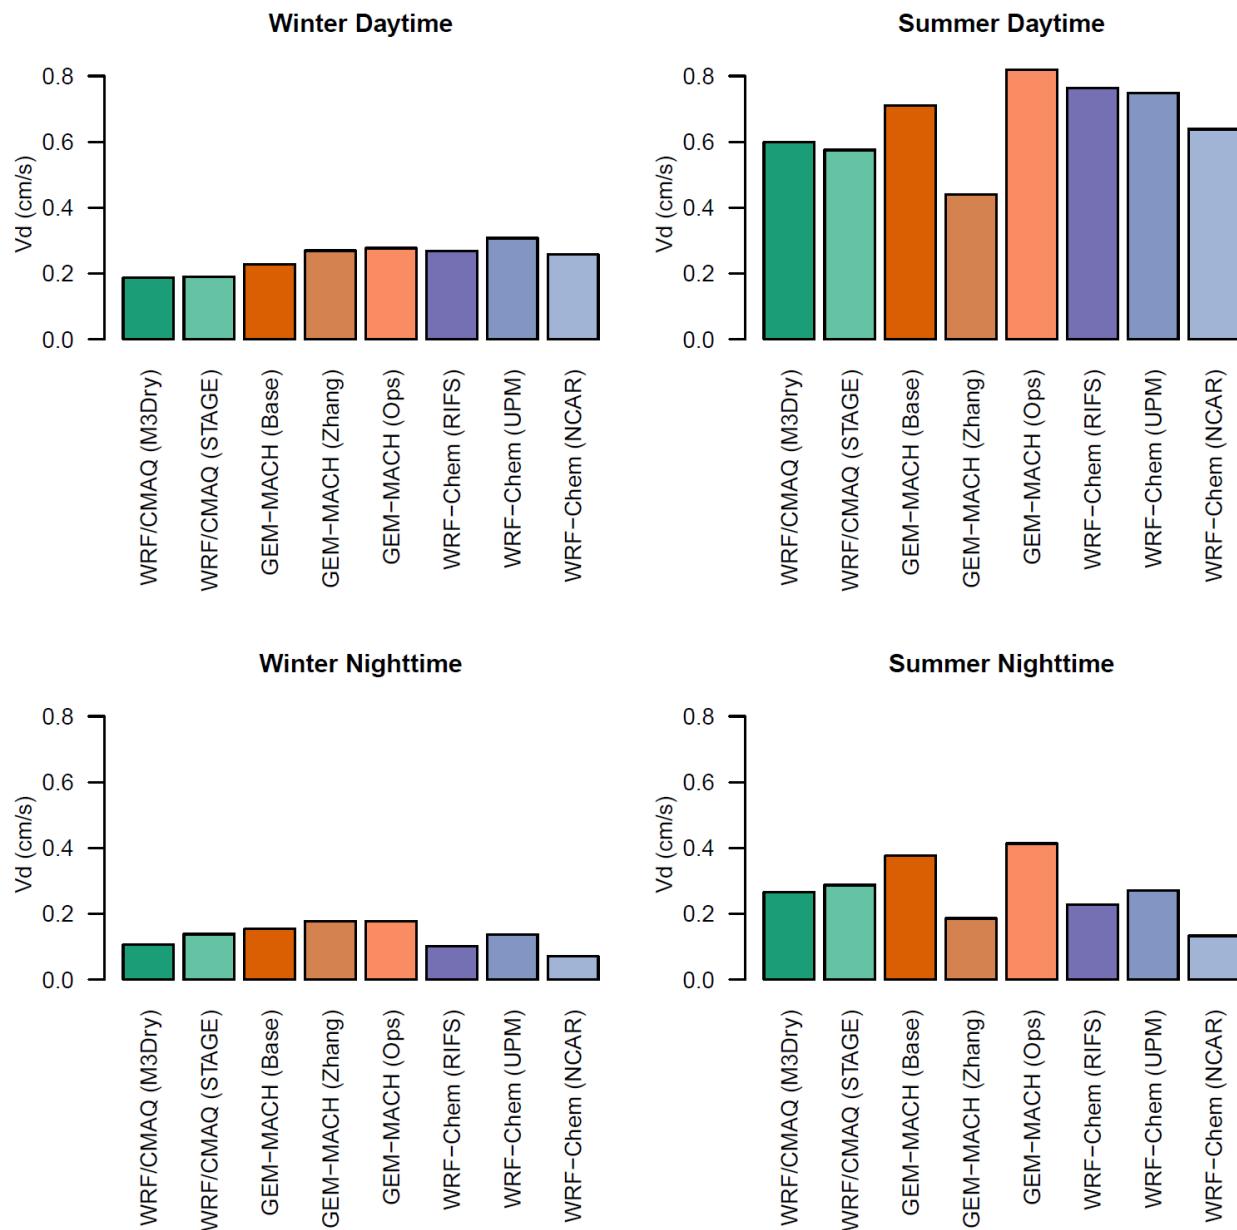

Figure S4: Seasonal and diurnal variations in 2016 NA domain average O₃ grid-scale dry deposition velocities (in cm/s). Averages are calculated over all non-water grid cells in the analysis domain common to all models. Daytime values are calculated from 10:00 LST to 14:00 LST while nighttime values are calculated from 22:00 LST to 02:00 LST. a) winter daytime, b) summer daytime, c) winter nighttime, d) summer nighttime

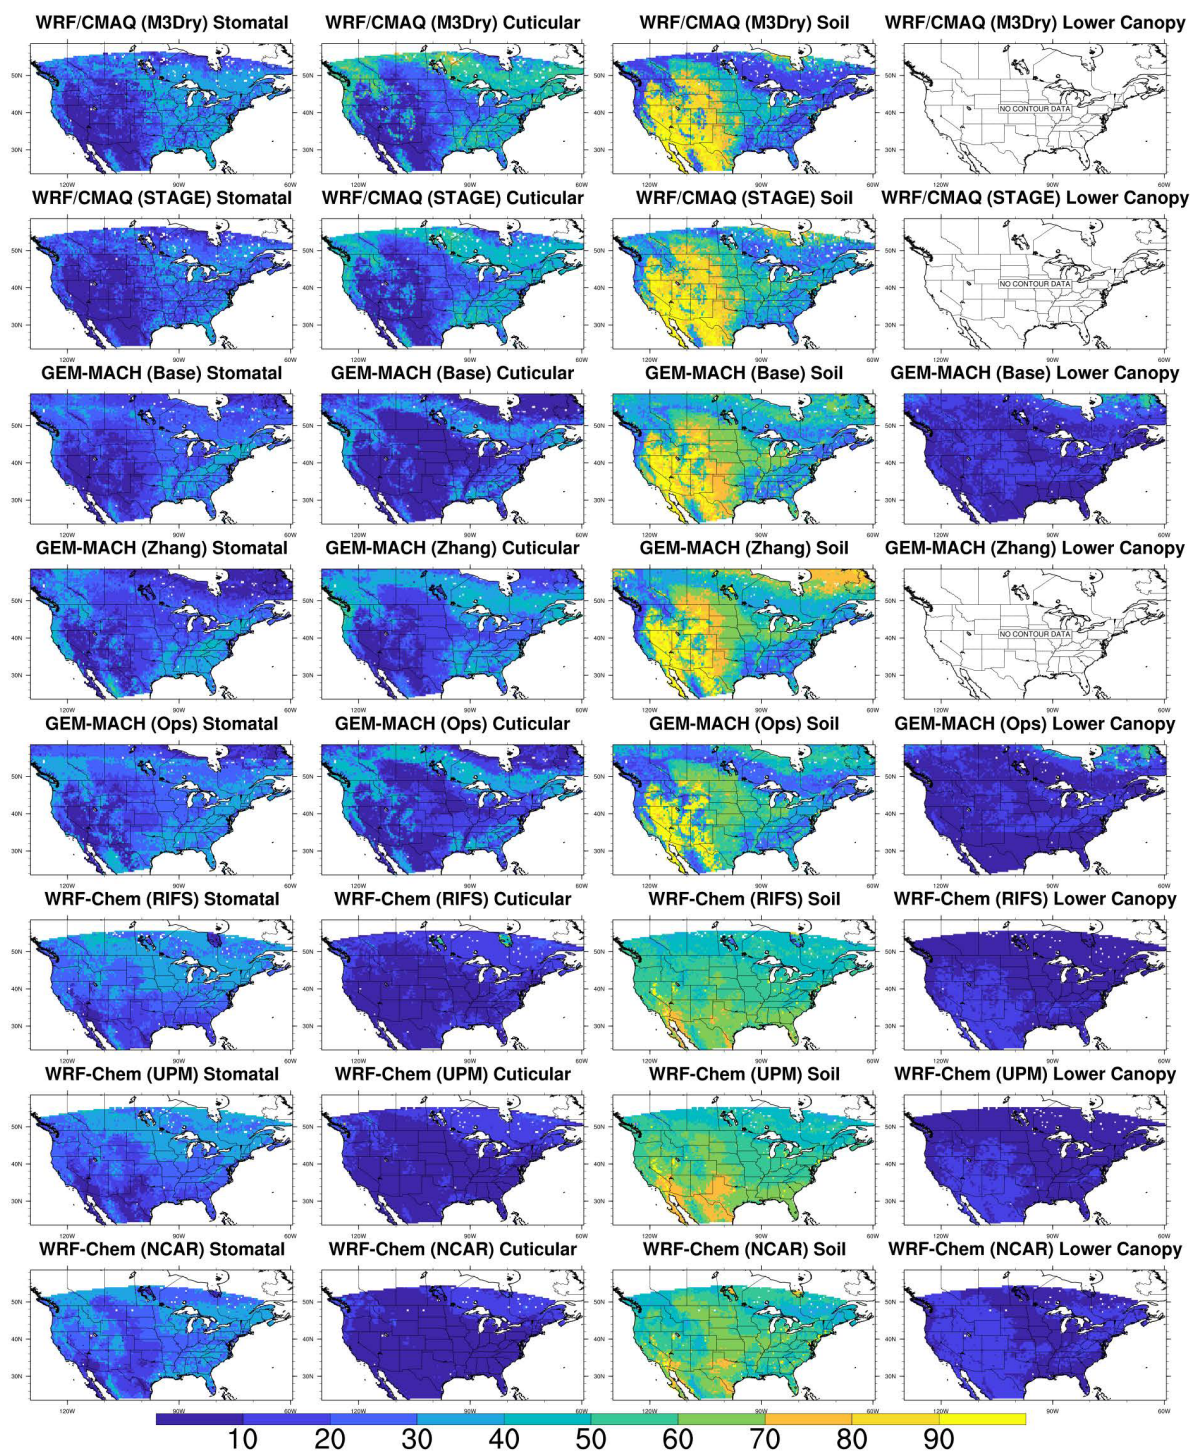

Figure S5: Percentage contributions of grid-scale ozone effective conductances to the sum of all pathways, averaged over the entire year. Results are for the NA domain during 2016. Note that these maps are not clipped to the domain common to all simulations and show the maximum spatial extent of non-water cells submitted for each model.

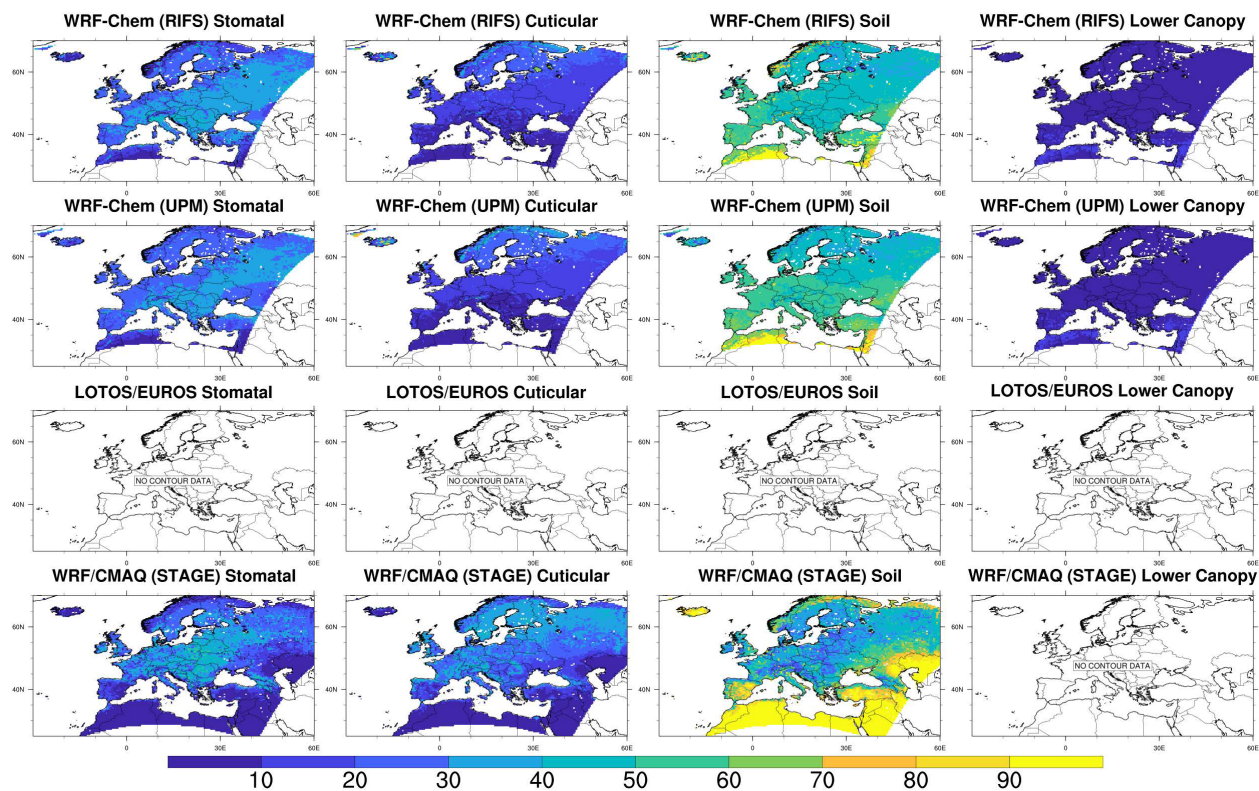

Figure S6: Percentage contributions of grid-scale ozone effective conductances to the sum of all pathways, averaged over the entire year. Results are for the EUR domain during 2010. Note that these maps are not clipped to the domain common to all simulations and show the maximum spatial extent of non-water cells submitted for each model.

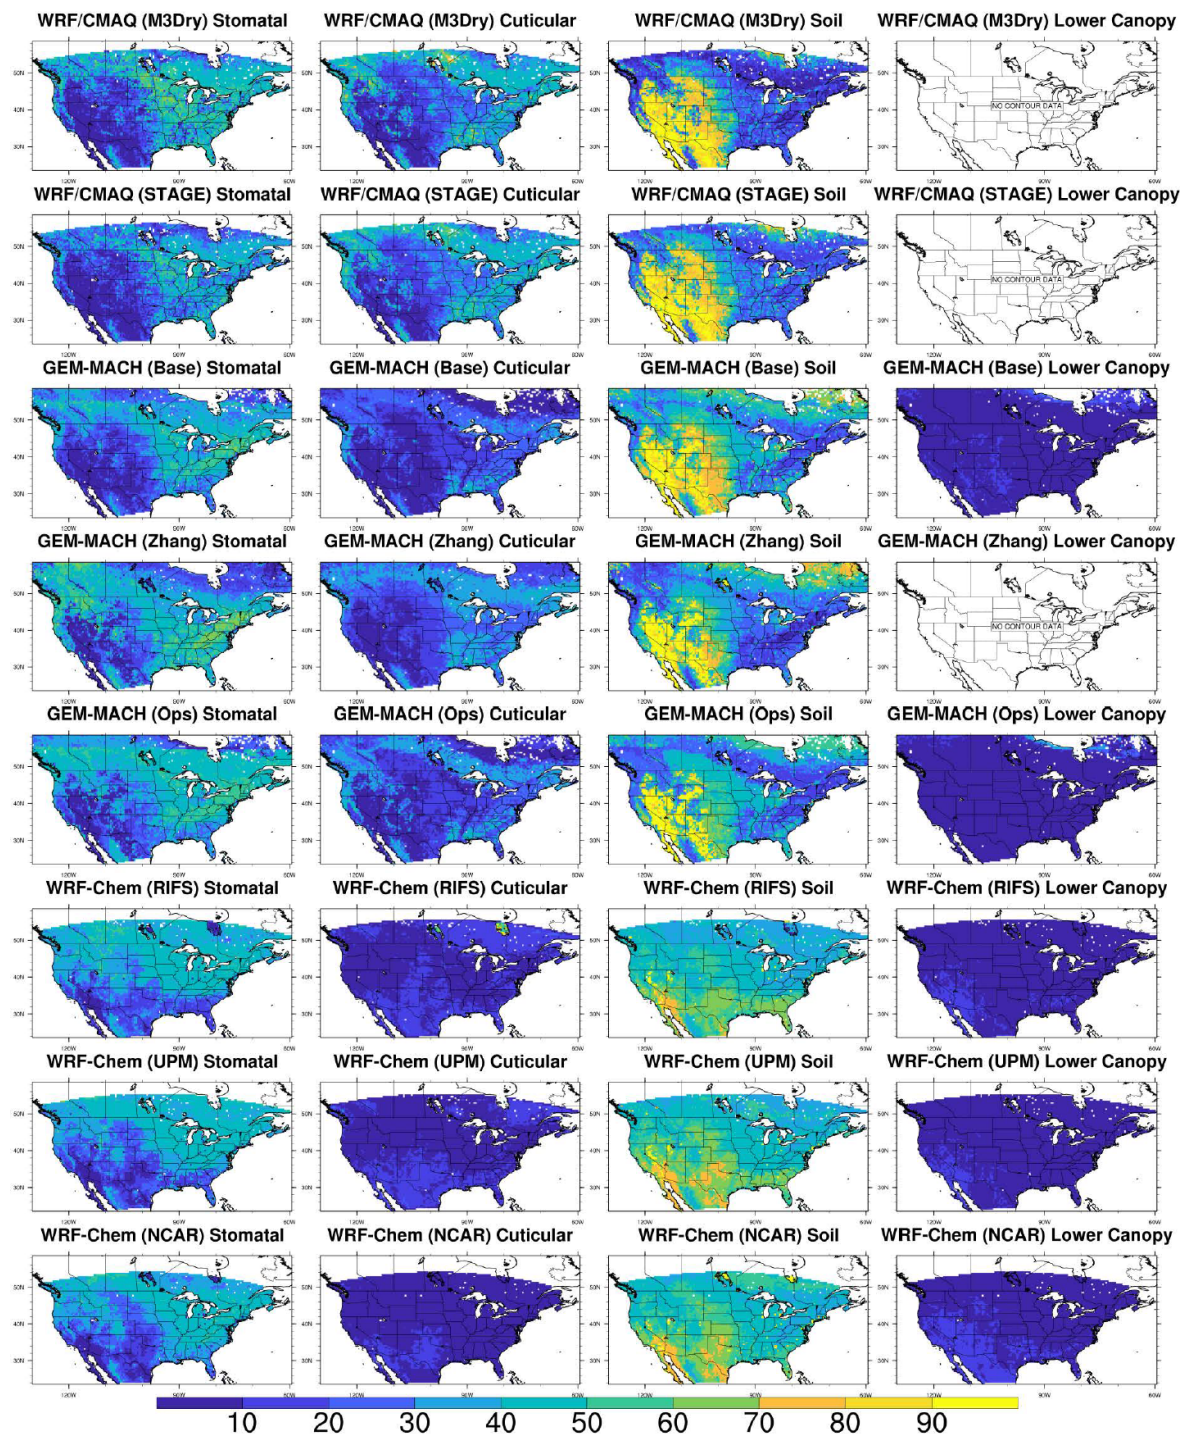

Figure S7. Percentage contributions of grid-scale ozone effective conductances to the sum of all pathways, averaged over all hours during summer. Results are for the NA domain during 2016. Note that these maps are not clipped to the domain common to all simulations and show the maximum spatial extent of non-water cells submitted for each model.

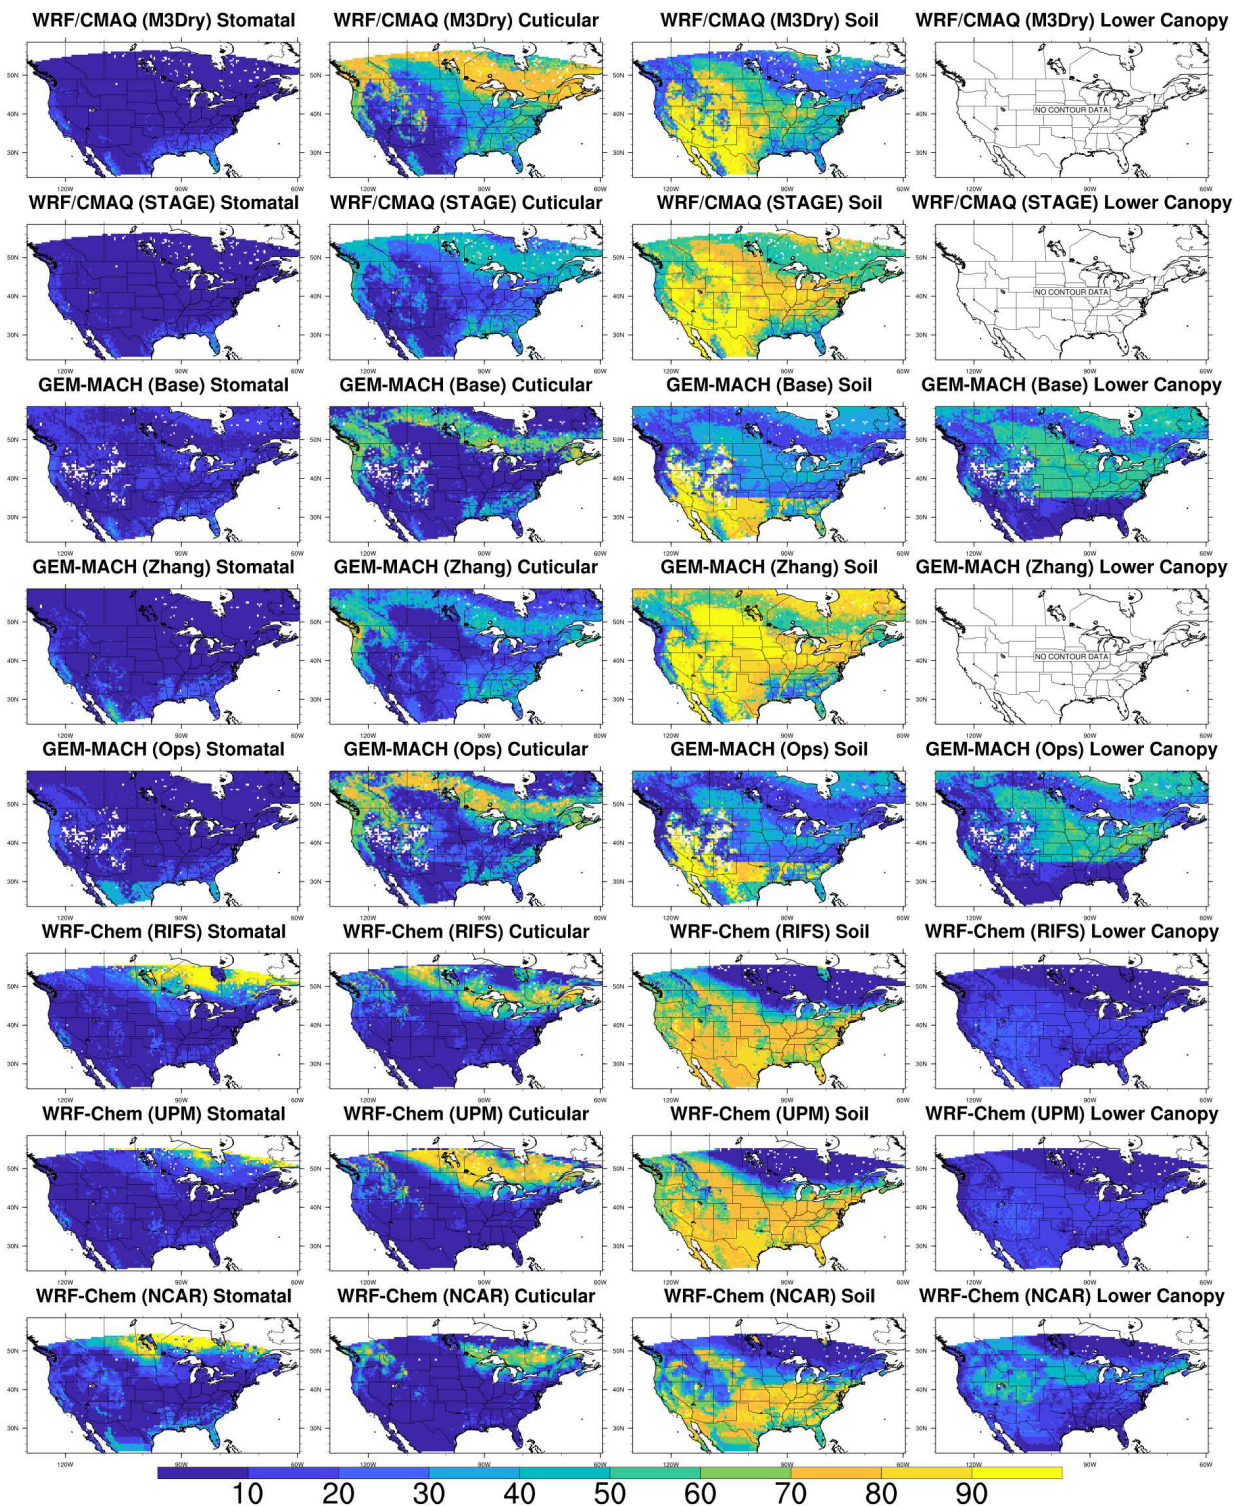

Figure S8: As in Figure S5 but for winter.

Figure S9: Summer and winter effective conductances and ozone deposition velocities calculated by the grid models for evergreen needleleaf forest grid cells and calculated by the corresponding subset of single point (SP) models analyzed in Clifton et al. (2023) at the Hyytiälä (HY) site. In the x-axis labels, results for the SP GEM-MACH Wesely and Zhang simulations are shown as “SP GM Wesely” and “SP GM Zhang”, respectively, while results for the SP WRF-Chem Wesely simulations are shown as “SP WC Wesely”. The evergreen needleleaf forest grid cells selected for this analysis are those in which a given model had at least 85% coverage for this LU category. The number of these grid cells differs across models due to underlying differences in LU (see Section 3.3).

Figure S10: Summer and winter effective conductances and ozone deposition velocities calculated by the grid models for deciduous broadleaf forest grid cells and calculated by the corresponding subset of single point (SP) models analyzed in Clifton et al. (2023) at the Ispra (IS) site. In the x-axis labels, results for the SP GEM-MACH Wesely and Zhang simulations are shown as “SP GM Wesely” and “SP GM Zhang”, respectively, while results for the SP WRF-Chem Wesely simulations are shown as “SP WC Wesely”. The deciduous broadleaf forest grid cells selected for this analysis are those in which a given model had at least 85% coverage for this LU category. The number of these grid cells differs across models due to underlying differences in LU (see Section 3.3).

Figure S11: Summer and winter effective conductances and ozone deposition velocities calculated by the grid models for grassland grid cells and calculated by the corresponding subset of single point (SP) models analyzed in Clifton et al. (2023) at the Easter Bush (EB) and Bugacpuszta (BP) sites. In the x-axis labels, results for the SP GEM-MACH Wesely and Zhang simulations are shown as “SP GM Wesely” and “SP GM Zhang”, respectively, while results for the SP WRF-Chem Wesely simulations are shown as “SP WC Wesely”. The grassland grid cells selected for this analysis are those in which a given model had at least 85% coverage for this LU category. The number of these grid cells differs across models due to underlying differences in LU (see Section 3.3).

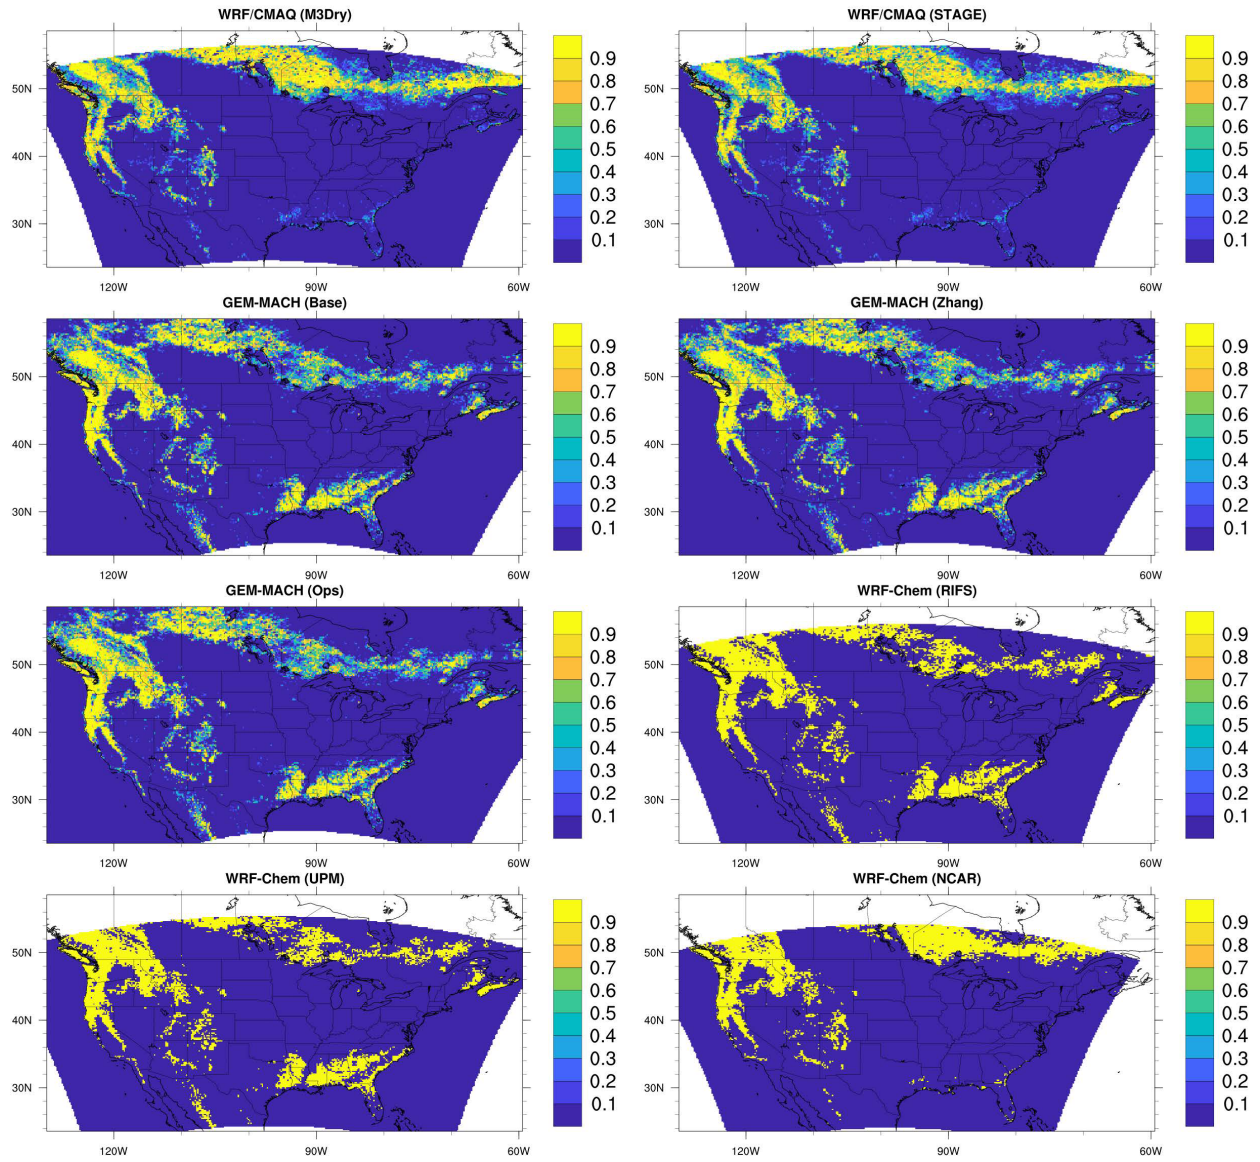

Figure S12: Fractional coverage of the evergreen needleleaf forest LU category for each of the participating models over the NA domain.

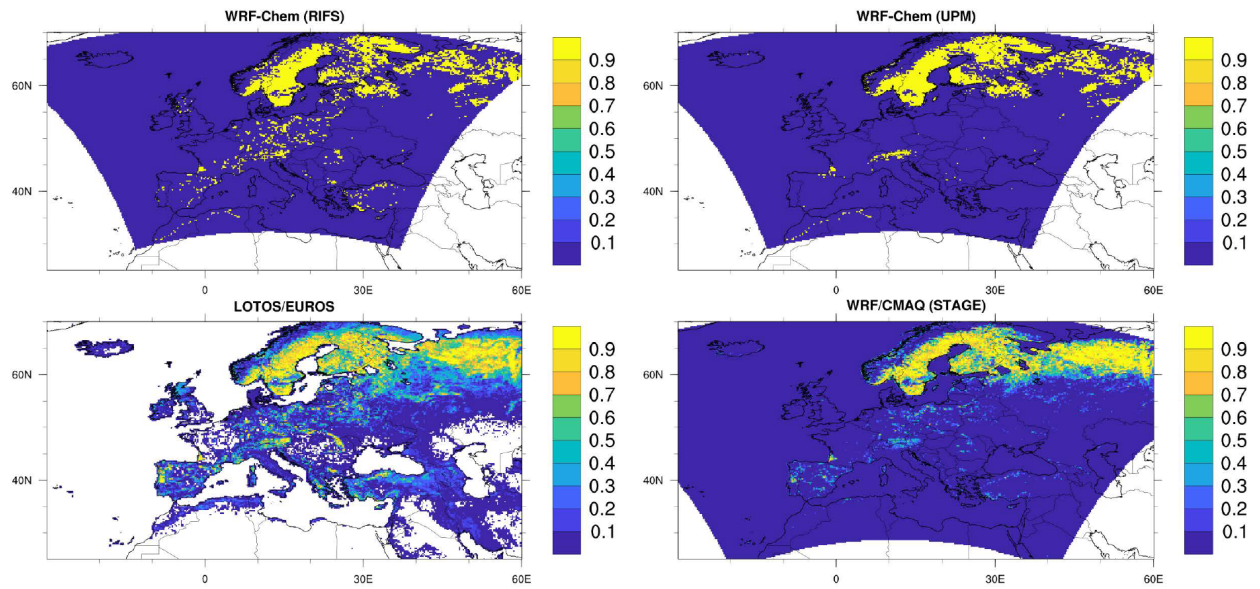

Figure S13: Fractional coverage of the evergreen needleleaf forest LU category for each of the participating models over the EUR domain.

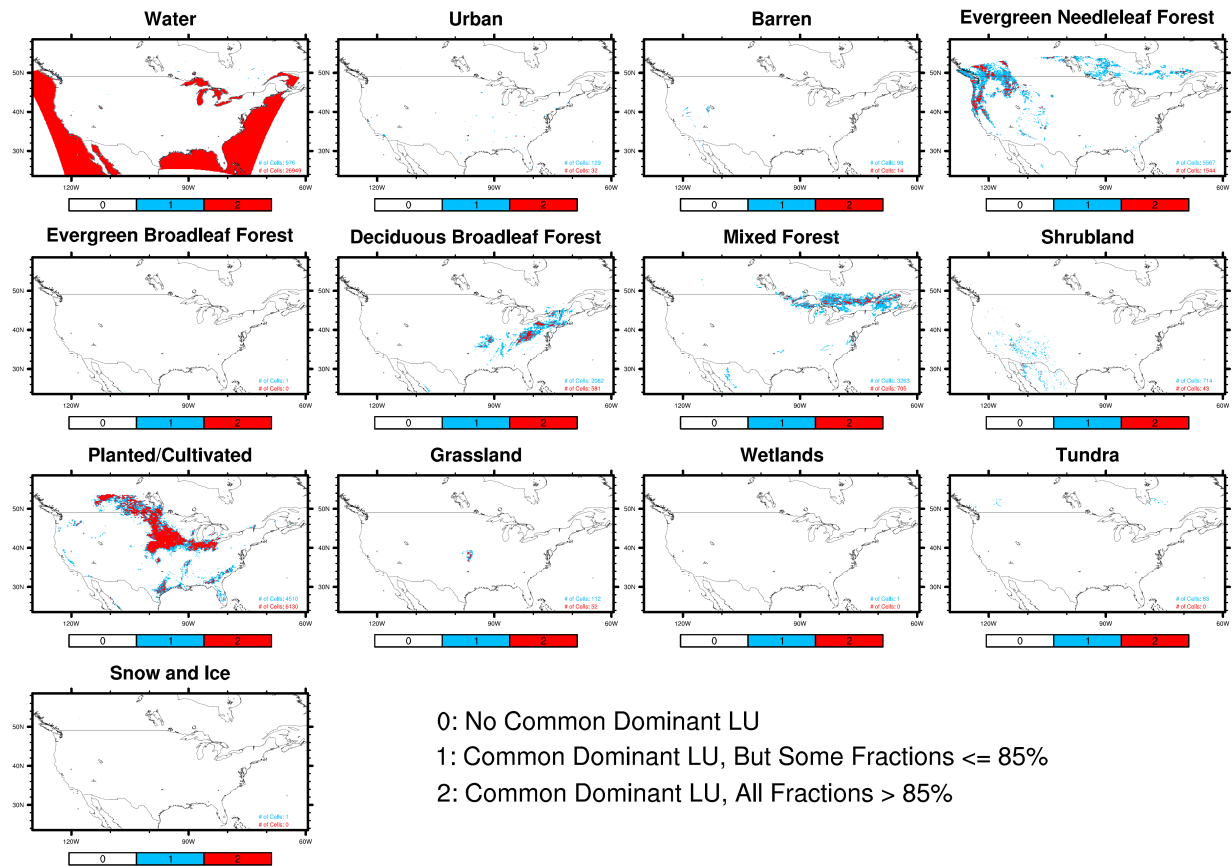

Figure S14: For each LU category, maps depicting the location of grid cells that i) do not share a common dominant LU category across models (white cells), ii) share a common dominant LU category across models but not all models have a fractional coverage $> 85\%$ for that LU category (blue cells), or iii) share a common dominant LU category across models and all models have a fractional coverage $> 85\%$ for that LU category (red). Results show are for the NA domain. The number of blue and red cells is shown as insert in each map. No maps are shown for the deciduous needleleaf forest, herbaceous, and savanna LU categories because there is not a single common dominant LU grid cell across models for these categories (see Table 5).

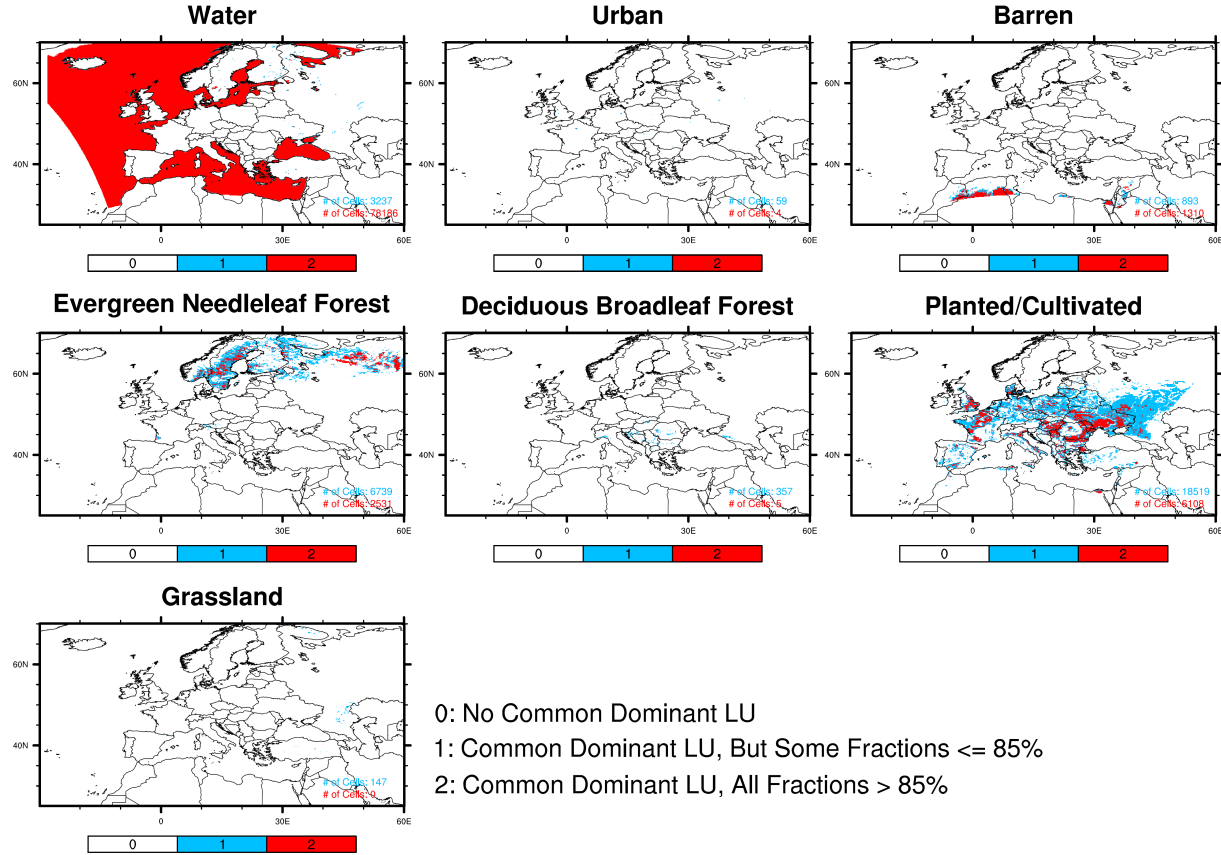

Figure S15. For each LU category, maps depicting the location of grid cells that i) do not share a common dominant LU category across models (white cells), ii) share a common dominant LU category across models but not all models have a fractional coverage $> 85\%$ for that LU category (blue cells), or iii) share a common dominant LU category across models and all models have a fractional coverage $> 85\%$ for that LU category (red). Results show are for the EUR domain. The number of blue and red cells is shown as insert in each map. No maps are shown for the deciduous needleleaf forest, evergreen broadleaf forest, mixed forest, shrubland, herbaceous, savanna, wetlands, tundra, and snow and ice LU categories because there is not a single common dominant LU grid cell across models for these categories (see Table 5).

Figure S16. LU-specific annual domain-total dry deposition fluxes (Tg), LU-specific annual mean dry deposition velocity (cm/s), and percentage LU category domain coverage (excluding water grid cells) for seven selected LU categories over the EUR domain. For each LU category and model, the analysis considered grid cells in the analysis domain common to all models in which a given model had at least 85% coverage for this LU category. The number of these grid cells differs across models due to underlying differences in LU (see Section 3.3).
