S1. Evaluation of the model's performance in meteorological simulations

As listed in Table S3, the mean bias (MB) for air temperature and absolute humidity indicates that these variables in East China were only slightly underestimated by 0.1–0.3 K and 0–0.7 g/kg, respectively. The high index of agreement (IOA; > 0.96 in this study) further suggests the model's good capacity in reproducing the spatiotemporal variations of these variables during the cold seasons. For wind speed, the MB, root mean square error (RMSE) and IOA all fall within the recommended ranges, which is indicative of a satisfying model performance. However, the gross errors (GE) for wind direction over the six months nearly all exceed the recommended benchmark of 30°. Similar findings have been reported in other simulation studies (e.g., Borge et al., 2008; Wang et al., 2010; Zhang et al., 2012; Hu et al., 2016), where GE values below 30° for wind direction simulations are rarely achieved. In this study, the GE values are comparable or better than those reported in previous studies, suggesting that the performance in simulating wind direction is also acceptable.

In summary, the WRF model demonstrates strong performance in meteorological simulations based on the statistical metrics in Table S3. Valid meteorological simulations provide a solid foundation for accurately describing the influence of meteorological conditions on long-term PM_{2.5} pollution changes.

Figure S1. Changes in annual PM_{2.5}, SO₂ and NO_x emissions across different regions of East China (distributions shown in the left panel) in 2016 and 2017 relative to the 2015 levels.

Figure S2. Distribution of sites or cities where the observational datasets were used in the evaluation of model performance: (a) Meteorological sites ($n = 226$); (b) representative cities with air quality monitoring ($n = 15$).

Figure S3. North, south, west, east borders of the PRD in the budget analysis (originated from Qu et al. (2023)).

Figure S4. Comparison of PM_{2.5} concentrations in the nine municipalities of the PRD during the cold seasons of 2015-2017.

Figure S5. Number of days with various PM_{2.5} concentration spans in the PRD and its nine municipalities during the cold seasons of 2015-2017.

Figure S6. Comparisons between maximum daily 8-hour average concentrations (MDA8) of O_3 (a), daily concentrations of NO_2 (b) and SO_2 (c) from model results and observations in the PRD. NMB, normalized mean bias; R, correlation coefficient. “(*)” indicates that the p value is less than 0.05 for the comparisons.

Figure S7. Comparisons between daily mean $PM_{2.5}$ concentrations from model results and observations in the 15 representative cities to the north of the PRD (locations shown in Fig. S1b). NMB, normalized mean bias; R, correlation coefficient. “(*)” indicates that the p value is less than 0.05 for the comparisons.

Figure S8. Comparisons of regional source contributions to population-weighted mean PM_{2.5} sulfate (pSO₄) concentrations on the PM_{2.5} polluted days in the PRD. The scenario corresponding to each result is noted in red.

Figure S9. Same as Fig. S8 but for PM_{2.5} nitrate (pNO₃).

Figure S10. Same as Fig. S8 but for PM_{2.5} ammonium (pNH₄).

Figure S11. The examinations of budget conservation in the five simulation scenarios (*Base2015*, *Base2016*, *Base2017*, *L16O16M15* and *L16O16M17*) for the hourly $\text{PM}_{2.5}$ mass budgets in the PRD. The solid red lines are the fitted lines, and the dashed black lines are the 1:1 reference lines. k, slopes; R, correlation coefficient.

Figure S12. Mean diurnal variations of $PM_{2.5}$ mass budget on the polluted days of 2015-2017 cold seasons (emissions fixed at the 2016 levels, or based on the scenarios *L16O16M15*, *Base2016* and *L16O16M17*) within the ABL of the PRD. Backgrounds in yellow and dark blue indicate daytime and nighttime periods, respectively.

Table S1. PM_{2.5} polluted days in the six representative months and corresponding daily mean PM_{2.5} concentrations (“conc”; unit: µg/m³) in the PRD

Oct. 2015		Dec. 2015		Oct. 2016		Dec. 2016		Oct. 2017		Dec. 2017

Table S2. Statistical metrics used in model evaluation. S_m , S_o indicate the values of meteorological variables or pollutant concentrations from modeling and observations, respectively, and σ_{S_m} and σ_{S_o} separately indicate their standard deviation.

Statistical metrics	Short name	Calculations
Mean Bias	MB	$\overline{S_m} - \overline{S_o}$
Gross Error	GE	$ \overline{S_m} - \overline{S_o} $
Normalized Mean Bias	NMB	$\frac{\overline{S_m} - \overline{S_o}}{\overline{S_o}} \times 100\%$
Root Mean Square Error	RMSE	$\sqrt{(\overline{S_m} - \overline{S_o})^2}$
Correlation Coefficient	R	$\frac{(\overline{S_m} - \overline{S_m})(\overline{S_o} - \overline{S_o})}{\sigma_{S_m} \sigma_{S_o}}$
Index of Agreement	IOA	$1 - \frac{(\overline{S_m} - \overline{S_o})^2}{(\overline{S_m} - \overline{S_o} + \overline{S_o} - \overline{S_o})^2}$

Table S3. Statistical metrics in the evaluation of model performance in simulating meteorological variables. Recommend values for the metrics are from Emery et al. (2001). Results fail to meet the recommend values are marked in bold.

Variables	Metrics	Oct. 2015	Dec. 2015	Oct. 2016	Dec. 2016	Oct. 2017	Dec. 2017	Recommend values
Temperature	MB (K)	-0.26	-0.24	-0.21	-0.23	-0.28	-0.23	$\leq \pm 0.5$
	GE (K)	1.79	1.80	1.67	1.80	1.79	1.90	≤ 2
	IOA	0.97	0.98	0.97	0.98	0.97	0.98	≥ 0.8
Absolute humidity	MB (g/kg)	-0.62	-0.11	-0.67	-0.06	-0.70	-0.12	$\leq \pm 1$
	GE (g/kg)	1.17	0.64	1.13	0.68	1.16	0.65	≤ 2
	IOA	0.97	0.98	0.98	0.98	0.97	0.98	≥ 0.6
Wind speed	MB (m/s)	0.23	0.03	-0.09	0.23	-0.06	0.05	$\leq \pm 0.5$
	RMSE (m/s)	1.80	1.51	1.68	1.30	1.70	1.46	≤ 2
	IOA	0.80	0.85	0.81	0.80	0.84	0.81	≥ 0.6
Wind direction	MB ($^{\circ}$)	4.10	2.97	1.19	3.44	0.92	2.10	$\leq \pm 10$
	GE ($^{\circ}$)	33.53	30.19	30.51	34.28	29.49	33.57	≤ 30

Table S4. Comparisons of simulated AdjGR and $\varepsilon(\text{pNO}_3)$ in the PRD in five scenarios.

Scenarios	AdjGR	$\varepsilon(\text{pNO}_3)$
Base2015	2.29	70.6%
Base2016	2.94	67.7%
Base2017	2.91	61.7%
L16O16M15	2.63	69.8%
L16O16M17	2.79	63.1%
