Species	к	ρ (g cm ⁻³)
Black Carbon (Aged)	0.035 ª	1.8 ^b
Black Carbon (Primary)	0.00 ^{c,d}	0.45 ^e
Dust (AlSiO ₃)	0.001 f	3.8
NaCl	1.24 ^g	2.16
Organics (Aged)	0.10 ^{h,i,j}	1 ^k
Organics (Primary)	0 1	1 ^k
Secondary Organic Aerosol (C15H38O2)	0.15 ^{m,n}	1.4
Sulfate as Ammonium Sulfate ((NH ₄) ₂ SO ₄)	0.61°	1.77
Sulfate as Ammonium Bisulfate (NH4HSO4)	0.56 ^p	1.78

10 S1. CAM-chem Model Configuration

11 The Community Atmosphere Model coupled with chemistry (CAM-chem) is a component of the 12 Community Earth System Model (CESM2.2) that represents the dynamics, physics, and chemistry of the atmosphere. The Multi-Scale Infrastructure for Chemistry and Aerosols (MUSICA) is a 13 14 configuration of CAM-chem, it is a next generation unified infrastructure to study atmospheric 15 chemistry at different horizontal grid resolutions. It is community-built, open-source, flexible, and 16 computationally efficient. MUSICA uses a modular approach within a unified framework to 17 represent aerosol and gaseous chemistry at smaller scales, where exposures are significant, while 18 being able to simulate their effects at a larger scale, such as on radiation which is important for 19 climate.

- 20 For the simulations performed here, CAM-chem is fully coupled to the land and prescribes
- 21 observed sea-surface temperatures and sea-ice. CAM-chem includes comprehensive tropospheric
- 22 and stratospheric chemistry (Emmons et al., 2020). CAM-chem includes the Modal Aerosol Model
- 23 (MAM4) and a Volatility Basis Set description with gas-phase SOA precursors (VBS-SOA) to
- simulate secondary organic aerosols (Tilmes et al., 2019; Emmons et al., 2020; and references
- therein).
- 26 MAM4 has four aerosol modes: Aitken, accumulation, coarse, and primary carbon which considers
- 27 elemental and organic carbon aging (Liu et al., 2016). Köhler theory is used to determine water
- 28 uptake and wet diameter in the troposphere from the relative humidity and volume mean
- 29 hygroscopicity per mode, and through which, with altitude information, the gravitational settling
- 30 velocities can be calculated. Information on how MAM4 treats nucleation, coagulation, 31 condensation, and evaporation in general, as well as water uptake and settling velocity calculations
- 31 condensation, and evaporation in general, as well as water uptake and settling velocity calculations
- 32 are described by Liu et al., (2016) and Liu et al., (2012).

The Volatility Basis Set (VBS) models organic aerosol evolution by categorizing organic aerosol particles by their volatilities, which affects their partitioning and condensation characteristics (Hodzic et al., 2016). VBS-SOA includes a comprehensive parameterization which includes updated removal mechanisms and the interaction of SOA with biogenics. This enables the identification of SOA precursors from biomass burning, anthropogenic sources, and biogenic missions. Details about VBS-SOA can be found in Tilmes et al. (2019).

Here, we are evaluating different horizontal resolutions of CAM-chem and MUSICA version 0 where both employ a spectral element (SE) dynamical core that allows regional refinement for up to 0.0625° from its default 1° (~111 km) resolution in a specified region of the world. The available regional refined grids were created by users for a variety of applications. We used a 1° base grid resolution (ne30) and a 0.25° (ne30x4) regionally refined output grid (which we label MUSICA) for East Asia that was developed at the NSF National Center for Atmospheric Research (NCAR)/Atmospheric Chemistry Observations and Modeling Laboratory (ACOM).

47 **Figure S1.** Vertical profiles of observed data (01:53 to 06:20 UTC) and CAM-chem model outputs 48 (06:00 UTC) for ne30 \sim 1° and MUSICA 0.25° grids for the tropical cyclone-induced convection 49 case on 20 September 2019 at 500 m intervals. (a) Submicron aerosol mass concentration for SO₄²⁻

50 and NH₄⁺ from AMS data and CAM-chem output of sulfate (NH₄HSO₄), (b) submicron aerosol

51 mass concentration for organics from AMS data and CAM-chem, and (c) total CO concentration

52 from observations and CAM-chem. The lines correspond to the median values of data in the given

53 altitude intervals and the bars correspond to the 25th and 75th percentile values.

Figure S2. Vertical profiles of observed data (02:55 to 06:02 UTC) and CAM-chem model outputs (06:00 UTC) for ne30 ~1° and MUSICA 0.25° grids for the shallow convection case on 24 September 2019 at 500 m intervals. (a) Submicron aerosol mass concentration for SO_4^{2-} and NH_4^+ from AMS data and CAM-chem output of sulfate (NH₄HSO₄), (b) submicron aerosol mass concentration for organics from AMS data and CAM-chem, and (c) total CO concentration from observations and CAM-chem. The lines correspond to the median values of data in the given altitude intervals and the bars correspond to the 25th and 75th percentile values.
