GENERAL REMARKS The manuscript presents important data on aerosol optical properties and radiative effects for one of the most climate sensitive regions of the Earth. The presented analysis is based on a 3-year record of data on aerosol scattering, aerosol absorption, and particle number size distribution accompanied by measurements of aerosol optical thickness using a sun photometer. The data are sorted with respect to different conditions for pre-monsoon, monsoon and post-monsoon events. Air mass origin is tracked by a trajectory cluster analysis identifying three main

source regions. Additionally, events are separated according to pollution situations. From this important data set the authors calculate the aerosol radiative forcing for the different air masses and pollution situations.

The manuscript is of high relevance and clearly written. Minor comments refer basically to technical corrections.

SPECIFIC COMMENTS

Text

Page 5633, line 1: Please check the word “anthropized”; it may read “populated”.

Page 5634, line 13: Please avoid “very complete”; delete “very”.

Page 5641, line 1: I propose to write the number 2 as a word, i.e., “show two distinct”.

Page 5646, last line, same as above; change to “considered two cases”.

Page 5648, line 3: change to 3.5K/day.

References

Replace reference Petzold et al., 2002 by

Petzold, A. and M. Schönlinner, 2004: Multi-angle absorption photometry – a new method for the measurement of aerosol light absorption and atmospheric black carbon, *J. Aerosol Sci.*, 35, 421-441.

Check reference Clarke, A.D.; it is referenced in the text as Clarke, 1988 while the reference list says Clarke, 1989.

Tables and Figures

Table 1: Please use a consistent terminology in the manuscript, either `sigma_sc`, `sigma_abs` or `sigma_sp`, `sigma_ap`; I suggest using the latter one.

All figure captions are missing.
