Interactive comment on "Circular depolarization ratios of single water droplets and finite ice circular cylinders: a modeling study" by M. Nicolet et al.

Anonymous Referee #2

Received and published: 29 November 2011

This is a useful paper that can be accepted after a rather minor revision. In addition to the comments by the first Referee, please consider the following suggestions.

- 1. Define the superscript "T" on page 30129.
- 2. Page 30134, 3rd line. "inequality" should be "equality".
- 3. Page 30131, 6th line. According to Mishchenko, M. I., and J. W. Hovenier, 1995: Depolarization of light backscattered by randomly oriented nonspherical particles, Opt. Lett. 20, 1356-1358, the circular depolarization ratio for randomly oriented particles is

always greater than or equal to twice the linear depolarization ratio.
