

Interactive comment on “Atmospheric boundary layer characteristics over the Pearl River Delta, China during summer 2006: measurement and model results” by S. J. Fan et al.

Anonymous Referee #1

Received and published: 27 April 2011

(1) This revised manuscript is improved significantly compared to the earlier version. (2) The scientific merit is good. Results from this work are very useful for understanding of atmospheric environmental problems in the Pearl River Delta. (3) The presentation is still not clear. It is most likely caused by the relatively poor English. A careful editing by a professional English editor is required.
