Dear Authors,

In the specific comment #4, I erroneously took the ratio of the masses in the HLBs and LLB domains as $\sim 2:1$, reckoning the former twice. Indeed, the area enclosed in the 30N-30S belt is equal to that of the remaining high-latitude belts, when one considers a perfect sphere. This way, the "aggregate ~ 15 ppb lost from the HLBs" should be expected NOT as " ~ 30 ppb arriving into the LLB", but as the same ~ 15 ppb. Whereas this correction reduces the discrepancy, this number is still too large compared to 5-6 ppb presented for the LLB, as I noted in the comment.

I apologize for the potential confusion I have introduced unintentionally.
