

Interactive comment on “Atmospheric acidification of mineral aerosols: a source of bioavailable phosphorus for the oceans” by A. Nenes et al.

A. Nenes et al.

nenes@eas.gatech.edu

Received and published: 13 May 2011

We thank the reviewer for the enthusiastic response and suggestions for improvement.

The only substantive comment is that the methods should be in the main text and not an appendix: should be easy to move the whole appendix up to methods.

Good point! Done.

Otherwise minor comments:

1. I think the magenta and blue are too similar: more different colors would be preferred (red and blue)?

C3295

Done.

2. I also encourage you to cite Alex Baker's data Baker et al., 2008: Deep sea research, which showed a gradient in P in dust coming off the coast of North Africa.

Done.
