

Interactive comment on “The H₂O–O₂ water vapour complex in the Earth’s atmosphere” by Y. Kasai et al.

Anonymous Referee #1

Received and published: 31 May 2011

There have been a number of papers that have suggested the presence of bound complexes in the Earth’s atmosphere. This paper presents the most convincing case to date. I reviewed the paper at the technical review stage and made a number of suggestions for improvements. They have been implemented and I have no further corrections to make.
