

***Interactive comment on “Characteristics of immersion freezing nuclei at the south pole station in Antarctica” by K. Ardon-Dryer et al.***

**Anonymous Referee #2**

Received and published: 3 March 2011

In my previous review I have forgotten to mention one point:

Minor details

- (P96 l 12) It not clear which criterion the authors use to eliminate “bad data” points (“contamination”) using the blank filter measurements. Why do you have used this criterion on the filter 7-12 but not on filter 1-6 . I call this a minor point only, because the correction is of minor importance to the results (like the authors state (P96 l 19)) and might be discarded.
