

Interactive comment on “The DAURE field campaign: meteorological overview” by O. Jorba et al.

O. Jorba et al.

oriol.jorba@bsc.es

Received and published: 14 March 2011

On behalf of all the co-authors I would like to thank the referee for his/her constructive comments on the manuscript.

We agree with the referee that the main content of the manuscript does not provide new scientific material. However, we believe that a descriptive manuscript about the meteorological conditions that occurred during the DAURE campaign may help future analysis on DAURE specific measurements presented in following manuscripts. In this sense, we decided to prepare a specific paper about the meteorological conditions of the campaign instead of providing the meteorological information as supplementary material. Following the Referee suggestion, we will emphasize those aspects about the meteorological conditions observed during DAURE that are more relevant and may

C831

be more scientifically novel.

Overall, we really appreciate the detailed revision of the manuscript, and referee's suggestions will be integrated into the revised version of the manuscript. A detailed response to all the referee's comments is under preparation and will be provided through the discussions section.
