First of all, I thank the reviewer for his/her comments and review.

Please let me reply to the comments one by one.

1. comment: Lee et al. investigated the hygroscopic properties of individual NaNO<sub>3</sub> particles. Specifically, they focused on the DRH and ERH of NaNO<sub>3</sub> particles ranging in size from 2.5 to 4 micrometers. The main conclusion from the results is that NaNO<sub>3</sub> particles do not homogeneously effloresce (i.e. homogeneously crystallize) for typical atmospheric relative humidities and time scales. In contrast, NaNO<sub>3</sub> particles contaminated with unidentified heterogeneous nuclei or NaNO<sub>3</sub> particles suspended on certain types of solid surfaces (such as Al foil or Ag foil) can effloresce heterogeneously at RH

C9733

values above 20%. The researchers have carefully performed the measurements, but I do not recommend the paper for publication in ACP for the following reasons: 1) as pointed out by Lee et al., several authors have already shown that NaNO<sub>3</sub> particles do not effloresce homogeneously under typical atmospheric RH conditions (see for example references [2] and [1]).

\* reply: Some researchers have observed DRH and ERH of NaNO<sub>3</sub> particles, but the others not. The point is that I want to explain why the hygroscopic behavior of NaNO<sub>3</sub> standard particles has been controversial, which has never been investigated systematically before.

2. comment: The heterogeneous results are not likely atmospherically relevant. Even though the authors observed heterogeneous nucleation in the laboratory, this doesn't mean that the same process will occur in the atmosphere. One suggestion for the authors is to carry out experiments using heterogeneous nuclei typically found in the atmosphere, such as mineral dust or soot particles. In the current manuscript, I don't see the connection between the heterogeneous results and the atmosphere.

\* reply: If the heterogeneous results are not atmospherically relevant, then I would like to ask whether the homogeneous systems which have been published by many people in atmospheric environmental journals including ACP so far are atmospherically relevant.
