Received and published: 20 April 2012

Both reviewers found that the quality of your paper is poor and lacks in-depth discussion. They arise many questions regarding the way you analyze the data and find there are several shortcomings in the method. They consider that your conclusions are not supported by physical consideration and their concerns include questionable methodology. They both suggest to reject your manuscript.

Based on the reviews, your manuscript needs substantial revision and requires careful rewriting. So, I recommend you to not upload a revised version.
