It would be interesting to relate the results of Figure 5 with the Figure 9 (middle panel) of Ginoux et al. (2004, http://www.gfdl.noaa.gov/bibliography/related_files/png0401.pdf). The correlation between dust and NAO index seems to match quite nicely, although the periods don't totally overlapped. The simulated results of Ginoux et al. (2004) may help you interpret the regional variability of such correlation in Spain.
