## ***Interactive comment on “Aerosol-precipitation interactions in the southern Appalachian Mountains” by G. M. Kelly et al.***

### **Anonymous Referee #1**

Received and published: 7 March 2012

The manuscript presents a statistical analysis of meteorological precipitation events and observed aerosol properties. However, the title is presumptuous, by suggesting that the manuscript would add to the current debate of aerosol/precipitation interaction. The precipitation events are catalogued following meteorological criteria separating seasons, frontal, non-frontal, etc rain. Some bulk aerosol parameters were measured at the same time. However, all quantities reported are bulk quantities, and the data are integrated over several hours. A discussion tries to explain the reported variations. The arguments, however, are pure speculation, as the data due not allow any such analysis. Consequently, I consider this is not a sound scientific analysis. I suggest to reject the manuscript.
