Thanks, Amy, for this thorough assessment of Johanna's paper. She will definitely be able to work on the points you mention. However, I am not sure whether ACP told you that the second paper for the same special issue is now also online. It focuses on “Temporal evolution of stable water isotopologues in cloud droplets during HCCT-2010): <http://www.atmos-chem-phys-discuss.net/12/15139/2012/>

It would be helpful for the revisions to know whether some of your questions actually could be dealt with using a more clear reference to the second paper, and where Johanna will have to add interpretations to still make the present paper understandable enough for the reader.

C4822

In any case – if you have time to also comment on the second paper this would really be helpful for us, not only for Johanna.
