

Interactive comment on “A Tropospheric ozone maximum over the equatorial southern Indian Ocean” by L. Zhang et al.

Anonymous Referee #1

Received and published: 14 March 2012

This paper provides source attribution for an observed maximum in tropospheric O₃ over the equatorial Southern Indian Ocean in May. It presents a concise description of the modeling study and uses multiple satellite datasets to support the observed effect.

My only major concern is the lack description of the precision (i.e., significance) of the observations. While the accuracy (bias) of the satellite data is described, there is no mention of how many observations are averaged or the calculation of standard error for the precision using the reported uncertainties, at least for TES and MLS. Figures should show error bars or, if the errors are relatively uniform, state the precision in the figure captions.

Minor comments: p. 1983, line 10, Are TES L3 data monthly or daily?

p. 1986, line 6: “local redistribution” is referenced, but a brief description would be useful.

p. 1987, line 10: “. . . we extracted model results at the time and location of the observations. . .” This should be more specific about what was done for each type of data, i.e., MLS L2 data would have different locations for each observation, but not TES L3, and both types should be selected for the observation times.

p. 1988, line 14: “GEOS-Chem simulations of tropospheric O3 undoubtedly bear the differences of. . .” would be better stated: “GEOS-Chem simulations of tropospheric O3 have significant dependence on. . .”

p. 1989, line 3: “convolute” should be “convolve”

Summary and conclusions: p. 1996, lines 19-29, Shouldn't this be specifically for May 2006? These are the values from Table 2, which only applied to 2006. Table 1. Is A3 for 2005 or 2006? Text refers to 2006 for A3. Figures 7-15 – Which GEOS-Chem set up is used for these?
