For the authors it is clearly indispensable to diffentiate bewteen 'core melt' and catastrophic accident. It is true, at Chernobyl and Fukushima core melts occured; but they were not the devastating cause for those accidents. In both casses the reactor building exploded, at Fukushima also the containment was demolished (Chernobyl hat no containment). Only in a secondary aspect the core melt essentially made available the radioactive debris spilled. There have been several other core melts with no such catastrophic effect. Consequently, it is not justified to extrapolate from the pooled data about core melts when the next blow of a reacto building will occur.
