I would like to draw the author's attention to another field investigation addressing potential in-canopy reaction of biogenic VOCs. The ECHO campaign was conducted in a deciduous forest dominated by beech that effectively attenuated actinic radiation entering the canopy (Bohn et al., J. Geophys. Res., 111, D12303, doi: 10.1029/2005JD006856, 2006). Consequently OH radical concentrations were low within the forest. A comparison with isoprene flux and isoprene concentration measurements at the same site (Spirig et al., Atmos. Chem. Phys., 5, 465–481, 2005) then

revealed that only a very minor fraction <1% of isoprene was subject to in-canopy loss  
(Bohn, J. Geophys. Res. 111, D15303, doi: 10.1029/2005JD006902, 2006).
