26 Table S5. National a posteriori emissions (Mg/yr) from inversions using ECMWF, Nest\_ECMWF,  
27 CFSR or FNL meteorological data in 2008.

	ECMWF	Nest_ECMWF	CFSR	FNL
Mongolia	3	5	20	19
China	2312	2355	2132	2204
Taiwan region	261	312	138	149
North Korea	65	100	37	124
South Korea	624	648	582	521
Japan	302	252	246	229
East Asia	3567	3672	3155	3246

28 Table S6. Inversion performance at Gosan, Hateruma and Cape Ochi-ishi for the 2006–2012 period. Mean and sd are the average observed mixing ratios and the  
29 corresponding standard deviation, respectively. N denotes the number of 3-hourly averaged observations.  $B_a$  and  $B_b$  denote the mean bias between the a priori  
30 concentrations and observations, and a posteriori concentrations and observations, respectively.  $E_a$  and  $E_b$  are the a priori and, a posteriori RMS errors for the full data  
31 set, respectively, including outliers.  $1-E_b/E_a$  represents the relative error reduction.  $E_b^n$  is the a posteriori error normalized with the standard deviation of the  
32 observed concentrations.  $r_a^2$  and  $r_b^2$  denote the squared Pearson correlation coefficients between the observations and the a priori and, respectively, a posteriori  
33 model results.  $r_{ba}^2$  and  $r_{bb}^2$  are the squared Pearson correlation coefficients between the observations and the a priori baseline and, respectively, a posteriori baseline.  
34  $r_{ea}^2$  and  $r_{eb}^2$  are the squared Pearson correlation coefficients between the observations and the a priori and a posteriori model concentrations, respectively, all with  
35 the a priori or a posteriori baseline subtracted.

Year	Station	Mean ppt	sd ppt	N	$B_a$ ppt	$B_b$ ppt	$E_a$ ppt	$E_b$ ppt	$1 - E_a/E_b$ %	$E_b^n$	$r_a^2$	$r_b^2$	$r_{ea}^2$	$r_{eb}^2$	$r_{ba}^2$	$r_{bb}^2$

38 Figure S1. Maps of the a posteriori emissions from UC\_adjust inversion (a), EDGAR inversion (b),  
 39 and difference between two inversions (EDGAR minus UC\_adjust; c) for 2008. Black dots denote the  
 40 measurement stations.

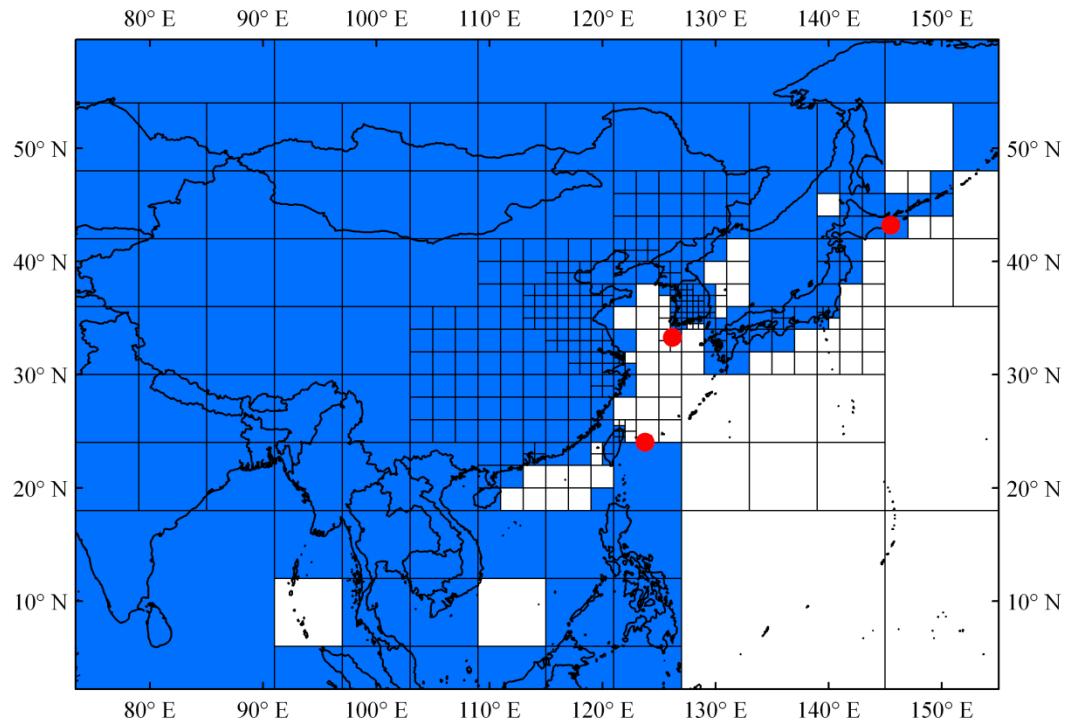

42

43 Figure S2. Dependence of a posteriori RMSE and squared correlation coefficients ( $r_b^2$ ,  $r_{eb}^2$ ) on the a  
44 priori emission uncertainty scale factor  $p$  for Gosan (a), Hateruma (b) and Cape Ochi-shi (c).

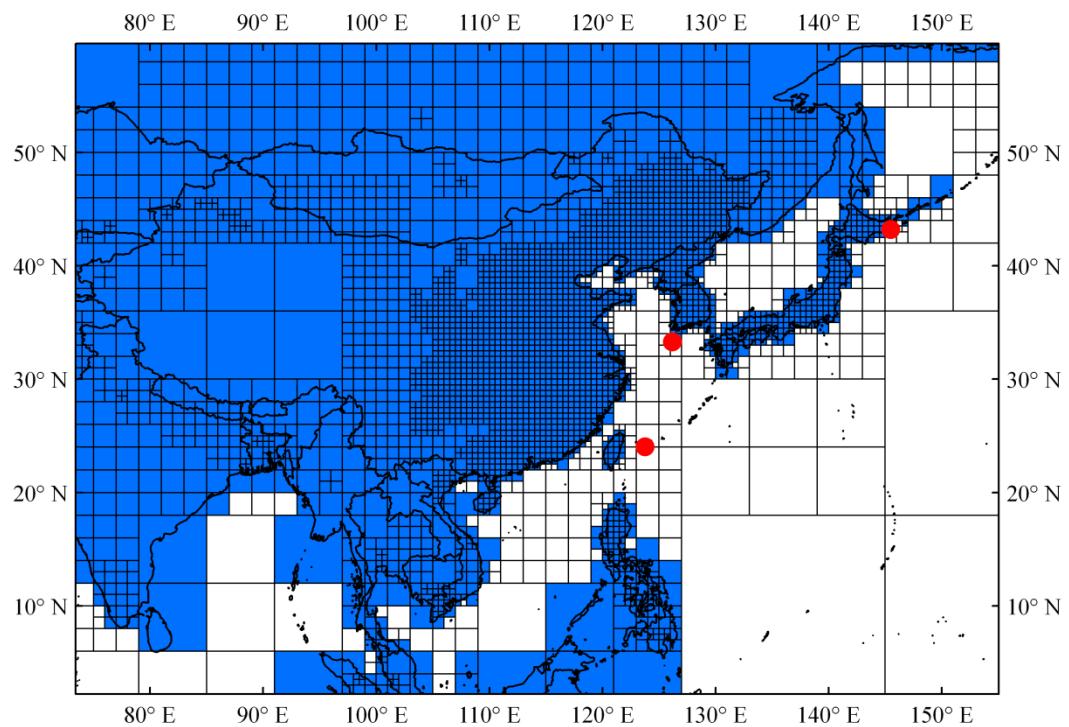

45

46 Figure S3. Maps of a posteriori emissions from inversions using  $0.5^\circ \times 0.5^\circ$  grid cells (a),  $1^\circ \times 1^\circ$  grid  
 47 cells (b) and difference between these two inversions (c) for the year 2008. Black dots denote the  
 48 measurement stations.

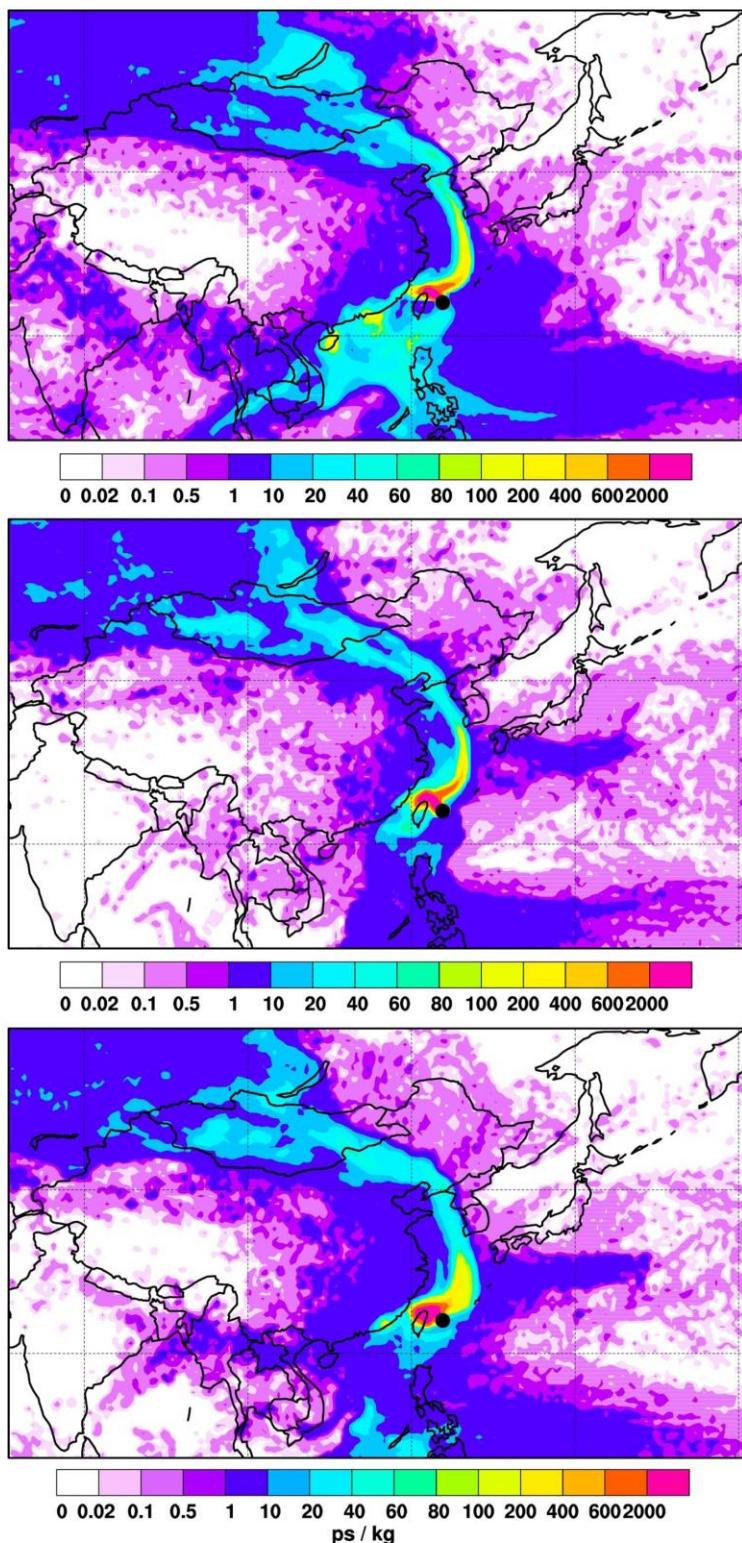

49

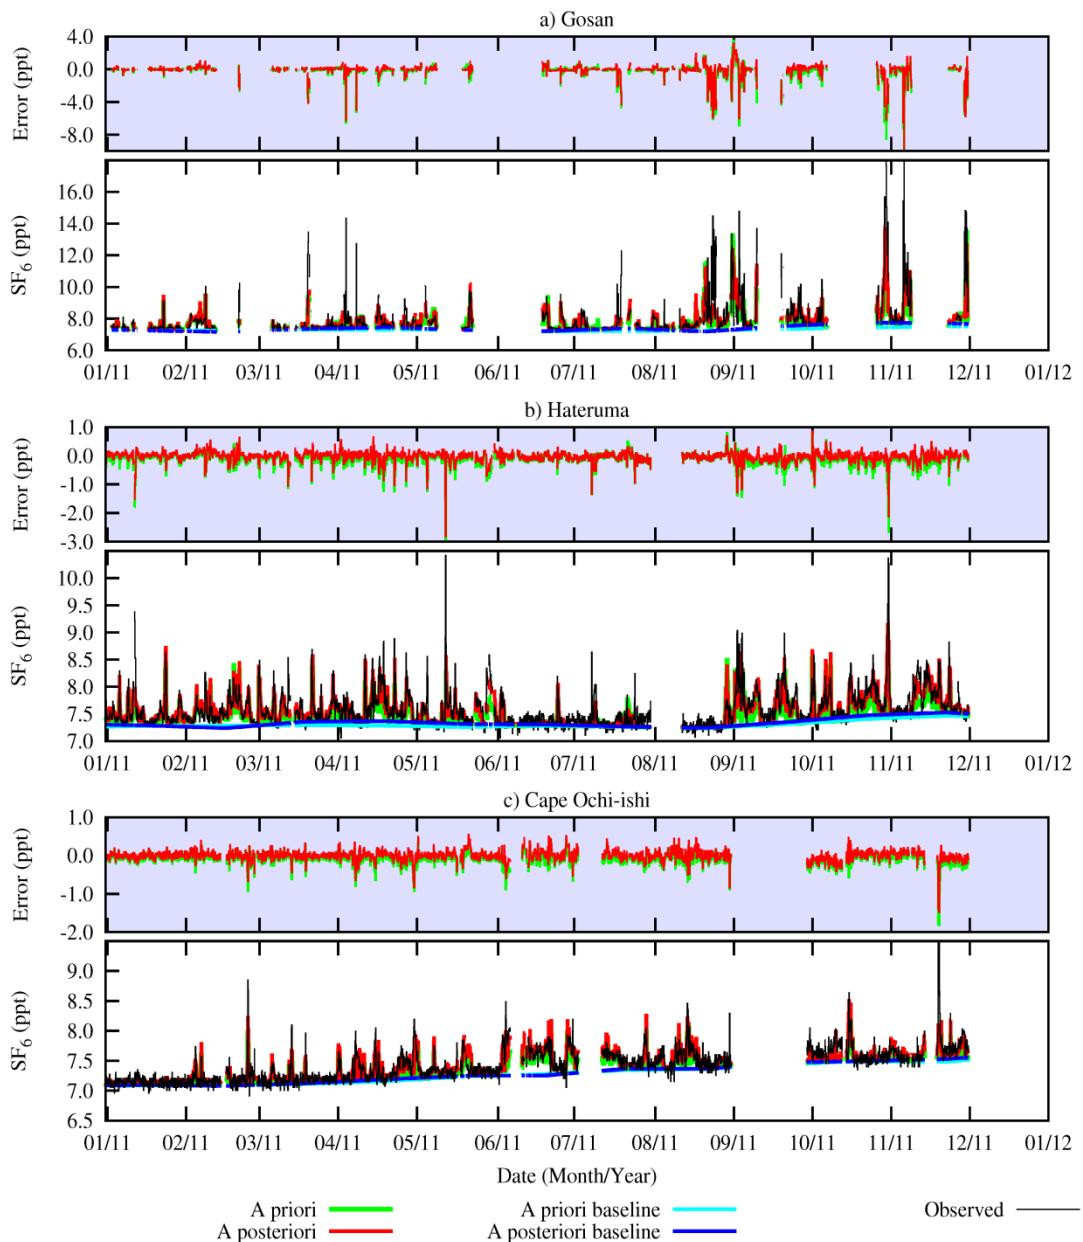

50

51 Figure S4. Maps of 546 (top panel) and 5323 (bottom panel) variable-resolution grid cells with  
 52 highest resolution of  $0.5^\circ \times 0.5^\circ$  used in the inversion. The red dots denote the measurement  
 53 stations. Blue boxes are considered in the inversion process and white boxes are not.

54

55 Figure S5. Emission sensitivity at 15:00 UTC on 8 May 2008 from simulation using ECMWF (top  
 56 panel), CFSR (middle panel) and FNL (bottom panel) meteorological data at the Hateruma station.

57

58 Figure S6. SF<sub>6</sub> time series for (a) Gosan, (b) Hateruma, and (c) Cape Ochi-ishi for the year 2011.  
 59 For every station, the lower panels show the observed and modeled mixing ratios. Modeled  
 60 mixing ratios are shown when using a priori (green line) and a posteriori emissions (red line).  
 61 Corresponding a priori (cyan line) and a posteriori (blue line) baselines are also shown. The upper  
 62 panels show the model errors when using the a priori emissions (green lines) and the a posteriori  
 63 emissions (red lines).
