1086
 1087 Figure S1: Observations of ethane vs. propane using canister measurements (5-8 PST) are well
 1088 correlated with a ratio similar to that expected based on the petroleum gas source profile.
 1089
 1090

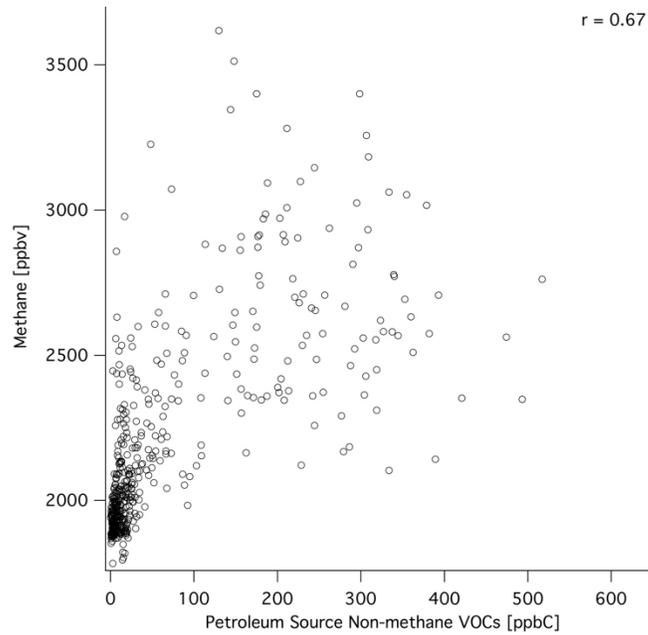

1091
 1092 Figure S2: Comparison of methylcyclohexane and isooctane at the Bakersfield ground site.
 1093 Isooctane is a prevalent tracer for gasoline emissions and its ratios to methylcyclohexane are
 1094 roughly equivalent for exhaust and non-tailpipe emissions. Many points agree with these ratios,
 1095 but numerous points have considerably more methylcyclohexane than expected. This result is
 1096 similar for many other compounds whose observed values are episodically greater than predicted
 1097 from gasoline and diesel sources.
 1098

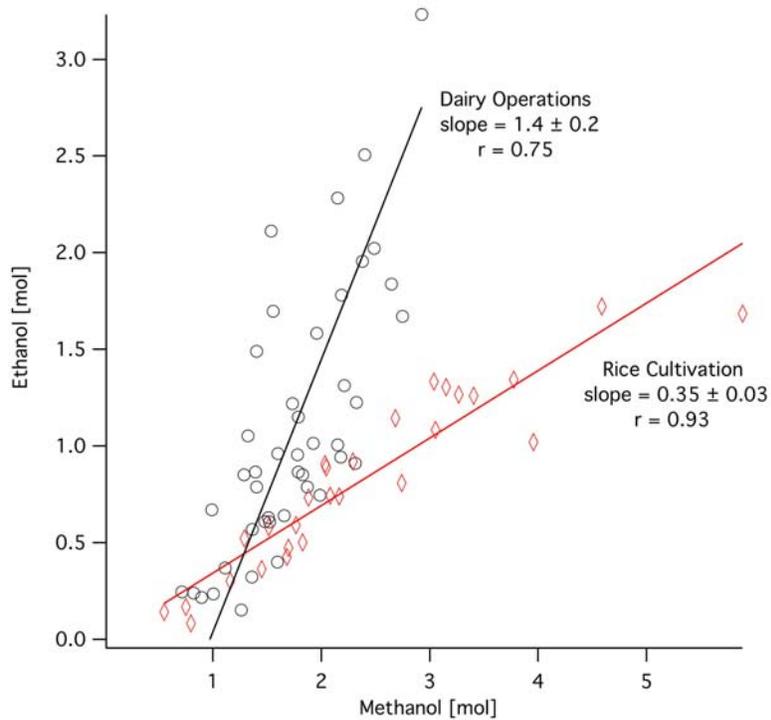

1099
 1100 Figure S3: Average diurnal pattern of the petroleum operation source contribution (before
 1101 “unexplained” mass is added).

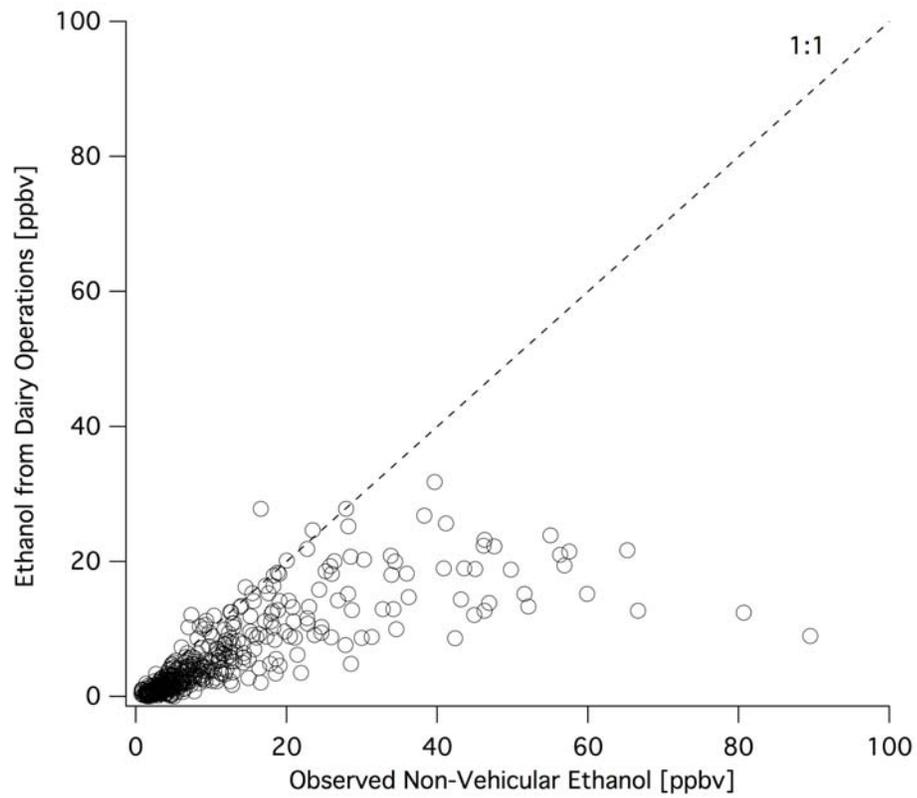

1102
 1103 Figure S4: The diurnal average of the ratio of petroleum gas (including “unexplained” mass) to
 1104 the sum of motor vehicle emissions.
 1105

1106
 1107 Figure S5: Observations of methane are not well correlated with the petroleum gas source and
 1108 much of the observed correlation can be attributed to simultaneous dilution or concentration due
 1109 to boundary layer effects.
 1110

1111
 1112 Figure S6: Canister measurements of ethanol and methanol taken via aircraft (flight dates: 5/7,
 1113 6/14, 6/16, 2010) show distinct ratios. Note: absolute ratios should be used with caution as
 1114 canister measurements were subject to losses of both alcohols.

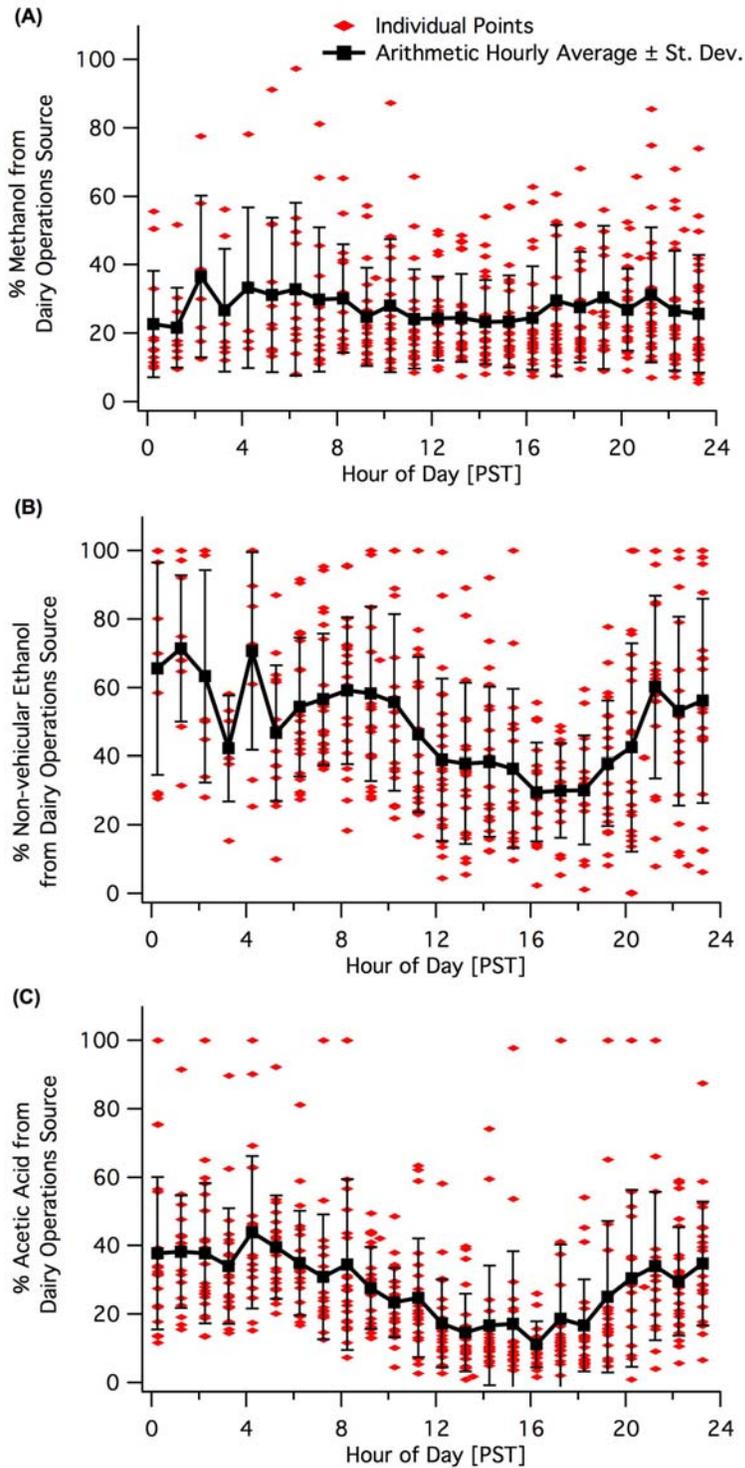

1115

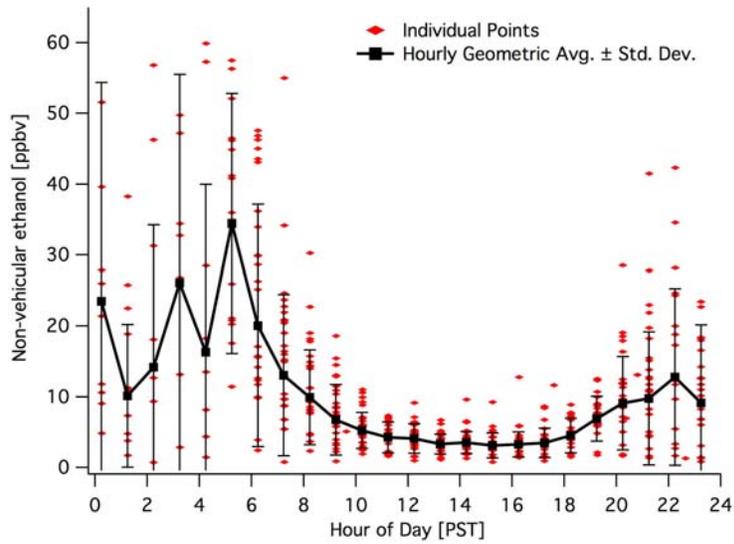

1116

1117

Figure S7: Similar to Figure 7, a comparison of ethanol from dairy operations against total observed non-vehicular ethanol.

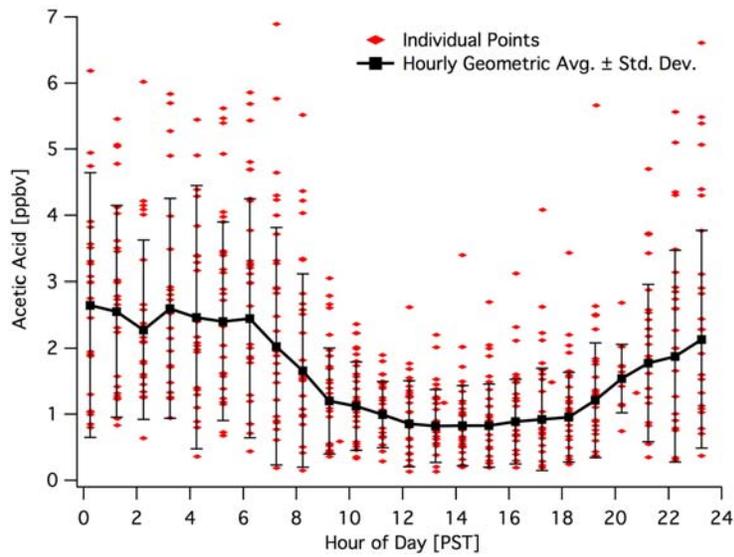

1118
 1119 Figure S8: Diurnal patterns for percentages of total observed (A) methanol, (B) non-vehicular
 1120 ethanol, and (C) acetic acid from dairy operations. Emissions from other sources of methanol
 1121 overwhelm the diurnal pattern of methanol emissions from dairy operations. Contributions of
 1122 ethanol and acetic acid from dairy operations comprise the smallest fraction of sources during the
 1123 day when biogenic and photochemical sources are most active.
 1124

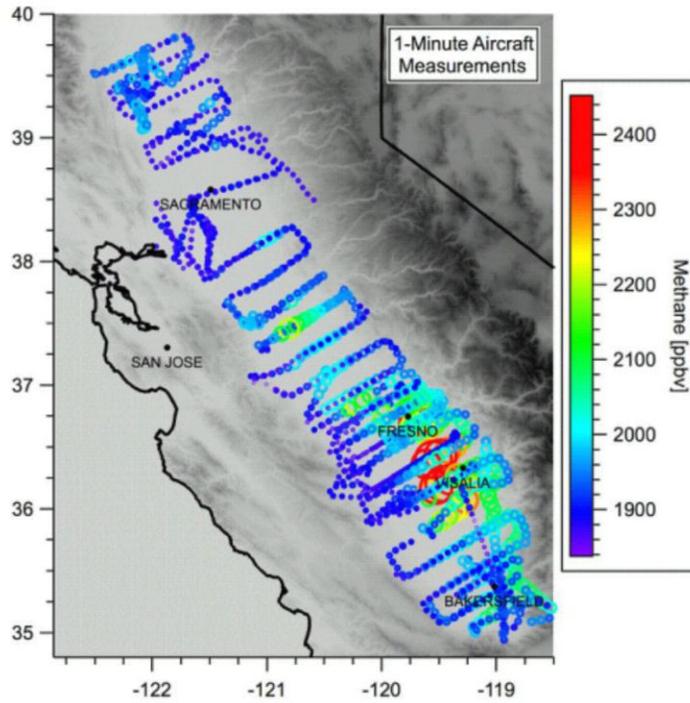

1125
1126

Figure S9: Diurnal pattern of non-vehicular ethanol at CalNex-Bakersfield

1127
1128
1129

Figure S10: Diurnal pattern of acetic acid at CalNex-Bakersfield

1130
1131 Figure S11: Methane aircraft measurements; similar to Figure 14, but including the Sacramento
1132 Valley
1133
