We thank the authors for their quick and thorough response. The Kim et al. reference is the one they have indicated (<http://www.atmos-chem-phys.net/15/10411/2015/acp-15-10411-2015.pdf>). I was referring to Figure 11d and the ISOPOOH to ISOPN ratio as an indicator of HO<sub>2</sub>:NO ratios as ISOPOOH comes from RO<sub>2</sub>+HO<sub>2</sub> and ISOPN from RO<sub>2</sub>+NO. Although GEOS-Chem does not provide a perfect prediction, it does capture the decline in ISOPOOH:ISOPN from August to September giving us some confidence in models' ability to predict high vs low-NO<sub>x</sub> branching.
