Chemistry of precipitation events does not appear indicated clearly in the link <http://www.tropicalmountainforest.org>. Nor is it necessary to include a large database. However, it is necessary to indicate the volume of precipitation collected in each event (or, for instance, by grouping individual precipitation events as monthly values) and its concentration of major chemical elements associated (e.g. Cl, Na, mainly). Database of chemical records includes chloride? I recommend including this essential information in an Appendix rather than as a link. The link may be subject to temporary incidents
