Remarks of Jerome Drake

The paper does not contain 'serious flaws' in either statistics or basic physics. I have fully answered the points made by Anonymous Reviewer#3. If you disagree with what I write, then please give some logical arguments. Regarding basic physics: the tractional tidal forces have all been calculated using the JPL ephemeris using relative position vectors of the sun, moon and earth over a 65 year period. There are also further details in the information supplement.

Beyond this, I can only respond to quantitative rational arguments.
