Interactive comment on “Impact of ozone observations on the structure of a tropical cyclone using coupled atmosphere–chemistry data assimilation” by S. Lim et al.

Anonymous Referee #2

Received and published: 20 June 2015

An ensemble-based data assimilation, the maximum likelihood ensemble filter (MLEF) is employed and interfaced with the WRF-Chem to investigate the impact of ozone (O₃) assimilation on the structure of a tropical cyclone (TC).

The results show that the O₃ assimilation has a notable impact on the analyses of other chemical variables (e.g., NO₂ and SO₂) as well as O₃ itself, and atmospheric variables (e.g., wind, temperature and specific humidity), especially near the TC case considered.

Please indicate in some detail :

[Interactive Discussion](#)

[Discussion Paper](#)

- a. How was the coupling between MLEF and WRF-Chem implemented
- b. Please highlight the impact of including/excluding MLEF had on final result. c. Please highlight where in the WRF-Chem package is ozone taken into account.
- apart from these minor issues this is a well-written and presented ms and I recommend publication once the minor comments are addressed.
