Your observations are correct for the first decade of the 21st century. They are not for the 1990's, and are not for the past two years according to DMI. Greenland has begun regaining ice mass. No one knows whether this will continue. But there is evidence for some cyclicity not recognized by Hansen. See, for example, Wyatt and Curry, Stadium Wave. See essay Northwest Passage for early DMI ice maps, plus the first three ever successful NWP transits. That indelible actual history cannot be erased.
