

Interactive comment on “Intercontinental transport of nitrogen oxide pollution plumes” by M. Wenig et al.

M. Wenig et al.

Received and published: 23 April 2003

We agree that the observed event is a combination of transport of pollution NO_x from SA and in-situ lightning produced NO_x. However we think that the industrial emitted NO_x is providing the larger contribution. For a detailed description of the estimation of lightning NO_x please see the final version of the paper and our answers to the referee's comments who raised very similar concerns.
