I looked over a considerable portion of the IUPAC data review and am impressed with the amount and quality of work that has gone into it. As such, it doesn't lend itself to the types of comments that various research papers command. The various recommendations seem reasonable and well justified (there's always an element of subjectivity in data evaluation). The literature cited for the various reactions appears to be complete. This is a quality piece of work that will be of great use to the community. Those of us on the NASA Data Panel view our effort and the IUPAC effort as being highly complementary.
