

Interactive comment on “Forecasting for a Lagrangian aircraft campaign” by A. Stohl et al.

Anonymous Referee #2

Received and published: 28 June 2004

In this article, the authors expose the problems within making the decision of the trajectory to follow by the airplanes involve in a Lagrangian campaign. It sets clearly the fundamentals of the model that will be able to do that. A useful tool is presented and validated with data from an existing campaign.

The new campaign will be an opportunity to validate the model and to test its performance in real time. That would be able to apport relevant new information from the model. By the moment, we must be satisfied with this report. It is recommended to be published in ACP.
