

Interactive comment on “Aerosol light absorption in the North Atlantic: trends and seasonal characteristics during the period 1989 to 2003” by C. Junker et al.

Anonymous Referee #1

Received and published: 10 February 2006

This manuscript contains much valuable material on suspended airborne particulates, valuable especially on account of the long period over which the data have been collected. I am happy that my objections have been considered to such a large extent.

The conclusions about the increase of the attenuation coefficient of continental sector air should appear in the abstract as well.
