

Interactive comment on “The January 2006 low ozone event over the UK” by M. Keil et al.

M. Keil et al.

Received and published: 7 December 2006

This helpful comment has been used to investigate the low ozone event further. In particular, an analysis of the divergence in the stratospheric column over Reading during the low ozone event has been carried out. This shows, as indicated in the comment, that there is net divergence in the low to mid stratospheric air in the column on January 19th 2006.

This information has been added to the revised version of the paper. In addition, the description of the mini-hole processes had been altered to reflect the importance of divergence and advection.
