

Interactive comment on “Regional pollution potentials of megacities and other major population centers” by M. G. Lawrence et al.

M. G. Lawrence et al.

Received and published: 12 March 2007

We appreciate the positive overall review of this referee and the helpful specific comments. We plan to implement the majority of the detailed and technical suggestions (wherever they are still appropriate after the broader revisions), and will respond to these individually along with the revised version.

A few of the main comments of this referee were common to the other reviews as well, and are discussed in the general response to all referees. One additional major suggestion was for reversing the order of the descriptions for the model, metrics and tracers in the methods section, which we find very interesting; we will definitely try this and if it is found to indeed be more readable by all co-authors then will follow this suggestion in the revised version.
