

Interactive comment on “Air quality in North America’s most populous city – overview of MCMA-2003 Campaign” by L. T. Molina et al.

Anonymous Referee #2

Received and published: 26 April 2007

The paper by Molina et al. provides a very useful summary of the major results and conclusions from the MCMA-2003 project in Mexico City. The findings are important for understanding the local, regional, and global effects of air pollution in megacities and merit publication in ACP. The legibility of figures and figure legends should be checked/improved prior to final publication.
